# **Service and Troubleshooting**

#### \*SXV9 Inverter Air Conditioner Condenser Units with R-410A Refrigerant

Pride and workmanship go into every product to provide our customers with quality products. It is possible, however, that during its lifetime a product may require service. Products should be serviced only by a qualified service technician who is familiar with the safety procedures required in the repair and who is equipped with the proper tools, parts, testing instruments and the appropriate service manual. **REVIEW ALL SERVICE INFORMATION IN THE APPROPRIATE SERVICE MANUAL BEFORE BEGINNING REPAIRS.** 

For service information related to the Bluetooth® Shared Data Loader BTSDL01 referenced in this manual, please refer to the installation instructions for the BTSDL01 at www.coolcloudhvac.com/loaderuserguide

#### **IMPORTANT NOTICES**

# RECOGNIZE SAFETY SYMBOLS, WORDS AND LABELS

Pride and workmanship go into every product to provide our customers with quality products. It is possible, however, that during its lifetime a product may require service. Products should be serviced only by a qualified service technician who is familiar with the safety procedures required in the repair and who is equipped with the proper tools, parts, testing instruments and the appropriate service manual. **REVIEW ALL SERVICE INFORMATION IN THE AP-PROPRIATE SERVICE MANUAL BEFORE BEGINNING REPAIRS.** 

**HIGH VOLTAGE** 

DISCONNECT ALL POWER BEFORE SERVICING OR INSTALLING THIS UNIT. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

DO NOT CONNECT TO OR USE ANY DEVICE THAT IS NOT DESIGN CERTIFIED BY THE MANUFACTURER FOR USE WITH THIS UNIT. SERIOUS PROPERTY DAMAGE, PERSONAL INJURY, REDUCED UNIT PERFORMANCE AND/OR HAZARDOUS CONDITIONS MAY RESULT FROM THE USE OF SUCH NON-APPROVED DEVICES.

TO PREVENT THE RISK OF PROPERTY DAMAGE, PERSONAL INJURY, OR DEATH, DO NOT STORE COMBUSTIBLE MATERIALS OR USE GASOLINE OR OTHER FLAMMABLE LIQUIDS OR VAPORS IN THE VICINITY OF THIS APPLIANCE.

**NOTICE:** Inverter air conditioner models can only be matched with an AMVE<sup>\*\*</sup> air handler or TXV-V<sup>\*\*</sup> expansion valve kit. Damage resulting from operation with any other combination is not covered by our warranties.

#### SAFE REFRIGERANT HANDLING

While these items will not cover every conceivable situation, they should serve as a useful guide.

REFRIGERANTS ARE HEAVIER THAN AIR. THEY CAN "PUSH OUT" THE OXYGEN IN YOUR LUNGS OR IN ANY ENCLOSED SPACE. TO AVOID POSSIBLE DIFFICULTY IN BREATHING OR DEATH:

- NEVER PURGE REFRIGERANT INTO AN ENCLOSED ROOM OR SPACE. By LAW, ALL REFRIGERANTS MUST BE RECLAIMED.
- IF AN INDOOR LEAK IS SUSPECTED, THOROUGHLY VENTILATE THE AREA BEFORE BEGINNING WORK.
- LIQUID REFRIGERANT CAN BE VERY COLD. TO AVOID POSSIBLE FROST BITE OR BLINDNESS, AVOID CONTACT AND WEAR GLOVES AND GOGGLES. IF LIQUID REFRIGERANT DOES CONTACT YOUR SKIN OR EYES, SEEK MEDICAL HELP IMMEDIATELY.
- IF REFRIGERANT GAS LEAKS DURING INSTALLATION, VENTILATE THE AREA IMMEDIATELY. REFRIGERANT GAS WILL RESULT IN PRODUCING TOXIC GAS IF IT COMES INTO CONTACT WITH FIRE. EXPOSURE TO THIS GAS WILL RESULT IN SEVERE INJURY OR DEATH.
- AFTER COMPLETING THE INSTALLATION WORK, CHECK THAT THE REFRIGERANT GAS DOES NOT LEAK THROUGHOUT THE SYSTEM.
- DO NOT INSTALL UNIT IN AN AREA WHERE FLAMMABLE MATERIALS ARE PRESENT DUE TO RISK OF EXPLOSIONS THAT WILL RESULT IN SERIOUS INJURY OR DEATH.
- WHEN INSTALLING THE UNIT IN A SMALL ROOM, TAKE MEASURES TO KEEP THE REFRIGERANT CONCENTRATION FROM EXCEEDING ALLOWABLE SAFETY LIMITS. EXCESSIVE REFRIGERANT LEAKS, IN THE EVENT OF AN ACCIDENT IN A CLOSED AMBIENT SPACE, COULD RESULT IN OXYGEN DEFICIENCY.
- ALWAYS FOLLOW EPA REGULATIONS. NEVER BURN REFRIGERANT, AS POISONOUS GAS WILL BE PRODUCED.

THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY ("EPA") HAS ISSUED VARIOUS REGULATIONS REGARDING THE INTRODUCTION AND DISPOSAL OF REFRIGERANTS INTRODUCED INTO THIS UNIT. FAILURE TO FOLLOW THESE REGULATIONS MAY HARM THE ENVIRONMENT AND CAN LEAD TO THE IMPOSITION OF SUBSTANTIAL FINES. THESE REGULATIONS MAY VARY BY JURISDICTION. SHOULD QUESTIONS ARISE, CONTACT YOUR LOCAL EPA OFFICE.

### **IMPORTANT INFORMATION**

TO AVOID POSSIBLE EXPLOSION:

- NEVER APPLY FLAME OR STEAM TO A REFRIGERANT CYLINDER. IF YOU MUST HEAT A CYLINDER FOR FASTER CHARGING, PARTIALLY IMMERSE IT IN WARM WATER.
- NEVER FILL A CYLINDER MORE THAN 80% FULL OF LIQUID REFRIGERANT.
- NEVER ADD ANYTHING OTHER THAN R-22 TO AN R-22 CYLINDER OR R-410A TO AN R-410A CYLINDER. THE SERVICE EQUIPMENT USED MUST BE LISTED OR CERTIFIED FOR THE TYPE OF REFRIGERANT USED.
- STORE CYLINDERS IN A COOL, DRY PLACE. NEVER USE A CYLINDER AS A PLATFORM OR A ROLLER.

- TO AVOID POSSIBLE EXPLOSION:
- USE ONLY RETURNABLE (NOT DISPOSABLE) SERVICE CYLINDERS WHEN REMOVING REFRIGERANT FROM A SYSTEM.
- ENSURE THE CYLINDER IS FREE OF DAMAGE WHICH COULD LEAD TO A LEAK OR EXPLOSION.
- ENSURE THE HYDROSTATIC TEST DATE DOES NOT EXCEED 5 YEARS.
- ENSURE THE PRESSURE RATING MEETS OR EXCEEDS 400 LBS.

WHEN IN DOUBT, DO NOT USE CYLINDER.

To avoid possible injury, explosion or death, practice safe Handling of refrigerants.

THE COMPRESSOR PVE OIL FOR R-410A UNITS IS EXTREMELY SUSCEPTIBLE TO MOISTURE ABSORPTION AND COULD CAUSE COMPRESSOR FAILURE. DO NOT LEAVE SYSTEM OPEN TO ATMOSPHERE ANY LONGER THAN NECESSARY FOR INSTALLATION.

**NOTICE:** The entire system (combination of indoor and outdoor sections) must be manufacturer approved and Air-Conditioning, Heating and Refrigerant Institute (AHRI) listed.

**NOTE:** Installation of unmatched systems is not permitted. Damage or repairs due to installation of unmatched systems is not covered under the warranty.

**NOTICE:** Approved systems are combination of ComfortBridge compatible indoor unit and single-stage thermostat (with dehumidification function).

SYSTEM CONTAMINANTS, IMPROPER SERVICE PROCEDURE AND/OR PHYSICAL ABUSE AFFECTING HERMETIC COMPRESSOR ELECTRICAL TERMINALS MAY CAUSE DANGEROUS SYSTEM VENTING.

WARNING

**NOTICE:** When the outdoor unit is connected to main power, the inverter board has a small current flowing into it to be prepared for operation when needed. Due to this, the Control Board components have to be cooled even when the unit is not running. For this cooling operation, the condenser fan may come on at any time, including in the winter months. Any obstruction to the outdoor fan should be avoided at all times when the unit is powered to prevent damage.

The successful development of hermetically sealed refrigeration compressors has completely sealed the compressor's moving parts and electric motor inside a common housing, minimizing refrigerant leaks and the hazards sometimes associated with moving belts, pulleys or couplings.

Fundamental to the design of hermetic compressors is a method whereby electrical current is transmitted to the compressor motor through terminal conductors which pass through the compressor housing wall. These terminals are sealed in a dielectric material which insulates them from the housing and maintains the pressure tight integrity of the hermetic compressor. The terminals and their dielectric embedment are strongly constructed, but are vulnerable to careless compressor installation or maintenance procedures and equally vulnerable to internal electrical short circuits caused by excessive system contaminants.

In either of these instances, an electrical short between the terminal and the compressor housing may result in the loss of integrity between the terminal and its dielectric embedment. This loss may cause the terminals to be expelled, thereby venting the vaporous and liquid contents of the compressor housing and system.

A venting compressor terminal normally presents no danger to anyone, providing the terminal protective cover is properly in place.

If, however, the terminal protective cover is not properly in place, a venting terminal may discharge a combination of

- (a) hot lubricating oil and refrigerant
- (b) flammable mixture (if system is contaminated with air)

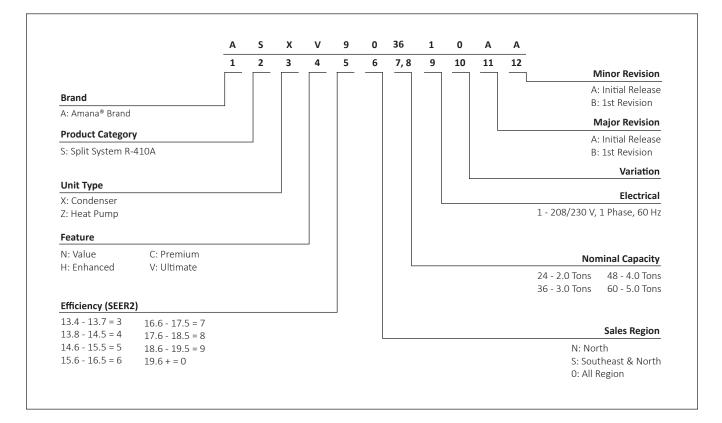

in a stream of spray which may be dangerous to anyone in the vicinity. Death or serious bodily injury could occur.

Under no circumstances is a hermetic compressor to be electrically energized and/or operated without having the terminal protective cover properly in place.

See Service Section for proper servicing.

### **PRODUCT IDENTIFICATION**

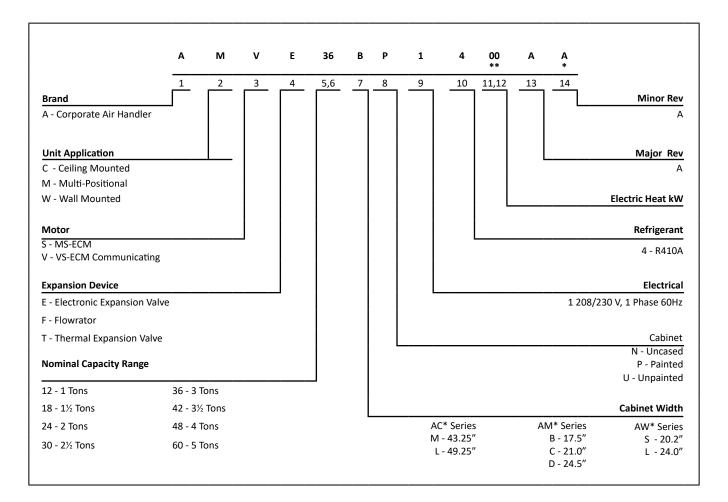

### NOMENCLATURES

This section gives a basic description of Air Conditioner condenser unit operation, its various components and their basic operation. Ensure your system is properly sized for heat gain and loss according to methods of the Air Conditioning Contractors Association (ACCA) or equivalent.

#### **CONDENSING UNIT**

The ambient air is pulled through the Air Conditioner condenser coil by a direct drive propeller fan. This air is then discharged out of the top of the cabinet. These units are designed for free air discharge, so no additional resistance, like duct work, shall be attached.

The gas and liquid line connections on present models are of the sweat type for field piping with refrigerant type copper. Front seating valves are factory installed to accept the field run copper. The total refrigerant charge for a normal installation is factory installed in the Air Conditioner condenser unit.

\*SXV9 models are available in 2 through 5 ton sizes and use R-410A refrigerant. They are designed for 208/230 volt single phase applications.

\*SXV9 R-410A model units use a Daikin rotary compressor. These models are ComfortBridge<sup>™</sup> and ComfortNet<sup>™</sup> ready.

There are a number of design characteristics which are different from the traditional compressors.

\*SXV9 models use "FVC50K" which is NOT compatible with mineral oil based lubricants like 3GS. "FVC50K" oil (required by the manufacturer) must be used if additional oil is required.

#### COOLING

The refrigerant used in the system is R-410A. It is a clear, colorless, non-toxic and non-irritating liquid. R-410A is a 50:50 blend of R-32 and R-125. The boiling point at atmospheric pressure is  $-62.9^{\circ}$ F.

A few of the important principles that make the refrigeration cycle possible are: heat always flows from a warmer to a cooler body. Under lower pressure, a refrigerant will absorb heat and vaporize at a low temperature. The vapors may be drawn off and condensed at a higher pressure and temperature to be used again.

The indoor evaporator coil functions to cool and dehumidify the air conditioned spaces through the evaporative process taking place within the coil tubes.

**NOTE:** The pressures and temperatures shown in the refrigerant cycle illustrations on the following pages are

for demonstration purposes only. Actual temperatures and pressures are to be obtained from the "Expanded Performance Chart".

Liquid refrigerant at condensing pressure and temperatures leaves the outdoor condensing coil through the drier and is metered into the indoor coil through the metering device. As the cool, low pressure, saturated refrigerant enters the tubes of the indoor coil, a portion of the liquid immediately vaporizes. It continues to soak up heat and vaporizes as it proceeds through the coil, cooling the indoor coil down to about 48°F.

Heat is continually being transferred to the cool fins and tubes of the indoor evaporator coil by the warm system air. This warming process causes the refrigerant to boil. The heat removed from the air is carried off by the vapor.

As the vapor passes through the last tubes of the coil, it becomes superheated. That is, it absorbs more heat than is necessary to vaporize it. This is assurance that only dry gas will reach the compressor. Liquid reaching the compressor can weaken or break compressor valves.

The compressor increases the pressure of the gas, thus adding more heat, and discharges hot, high pressure superheated gas into the outdoor condenser coil.

In the condenser coil, the hot refrigerant gas, being warmer than the outdoor air, first loses its superheat by heat transferred from the gas through the tubes and fins of the coil. The refrigerant now becomes saturated, part liquid, part vapor and then continues to give up heat until it condenses to a liquid alone. Once the vapor is fully liquefied, it continues to give up heat which subcools the liquid, and it is ready to repeat the cycle.

The inverter system can stop the compressor or outdoor fan to protect the unit. The inverter system can run higher compressor speed than required from thermostat to recover compressor oil that flows.

#### SYSTEM STARTUP TEST

**NOTICE:** On initial power start-up, the outdoor unit will display code E11, signaling that initial SYSTEM test must be run. Follow the instructions BELOW to initiate and complete the testing.

A system verification test is now required to check the equipment settings and functionality.

Inverter units are tested by any of the following methods:

- Setting the "SUt" menu (System verification test) to ON through the indoor unit control board push buttons.
- Setting the System verification test menu of mode display screen-4 to ON through the outdoor unit control board push buttons.
- Through the CoolCloud HVAC phone application.

Once selected, it checks the equipment for approximately 5 - 15 minutes. System test may exceed 15 minutes if there is an error. Refer to the Troubleshooting section, if error code appears.

Before starting the SYSTEM TEST, turn off the electric heater and gas furnace.

**NOTE:** If the unit is attempting to run SYSTEM TEST in under 20°F ambient temperature, the unit may not be able to complete the test due to low suction pressure. In such a case, re-run the SYSTEM TEST when the ambient temperature exceeds 20°F.

#### COOLCLOUD™ HVAC PHONE APPLICATION

The CoolCloud HVAC phone application designed to improve the contractor's setup /diagnostic experience. This application can only use with the ComfortBridge compatible indoor unit and can download through CoolCloud website at https://www.coolcloudhvac.com, Google Play or the Apple App Store.

Users can see specific model information, review active diagnostic error codes, observe system status during operation, make system menu adjustments, add site visit notes and run system testing of all operational modes (heat / cool / fan) directly from the phone.

The phone application is also capable of directly updating the ComfortBridge compatible indoor unit software anytime updates are available.

The application will automatically notify the user if updates are available.

**NOTE:** The software update may take up to 20 minutes to complete.

#### **CHARGE MODE**

CHARGE mode allows for charging of the system. System operates for a duration of approximately one hour while the equipment runs at full capacity.

After one hour, the CHARGE MODE ends and the system resumes normal operation.

Before starting the CHARGE MODE, turn off the Cool or Heat mode and electric heater or gas furnace.

- a. Inverter units are charged by any of the following methods:
  - Setting the "CR9" menu (Charge Mode) to ON through the indoor unit control board push buttons.

- Setting the Charge mode menu of mode display screen-4 to ON through the outdoor unit control board push buttons.
- Through the CoolCloud HVAC phone application.
- b. The System will remain in charge mode (high speed) for 60 minutes before timing out.
- c. When charge mode once complete, the installer must manually shut off.

**NOTE:** Charge mode is for validating sub cooling. To ensure a proper initial charge, the amount of refrigerant added must be weighed in after measuring the line set and calculating additional charge.

NOTICE: When put into CHARGE MODE the 7-segment display will begin blinking "cha" lights. Once the system is stable the "cha" lights will stop blinking and stay solid (will take around 30 minutes). Using service equipment, add or recover refrigerant according to the calculation in Step 1.

Do not adjust refrigerant level if the "cha" lights are not solid.

#### **BOOST MODE**

BOOST MODE can be enabled or disabled through the control board push buttons or through the CoolCloud app.

BOOST MODE allows the system to operate at increased compressor speed to satisfy unusual high loads. BOOST MODE is initiated by an outdoor temperature sensor located in the outdoor unit.

Please note that outdoor equipment operational sound levels may increase while the equipment is running in BOOST MODE. Disabling BOOST MODE will provide the quietest and most efficient operation.

BOOST MODE is ON by default and is activated when the outdoor temperature reaches 105°F. BOOST MODE can be disabled and enabled and the activation temperature adjusted in the Settings menu of the CoolCloud app or through the indoor / outdoor push button menus.

#### DEHUMIDIFICATION

The thermostat reads the indoor humidity level and allows the user to set a dehumidification target based on these settings. The thermostat controls the humidity level of the conditioned space using the cooling system. Dehumidification is engaged whenever a cooling demand is present and structural humidity levels are above the target level. When this condition exists, the circulating fan output is reduced, increasing system run time, over cooling the evaporator coil and ultimately removing more humidity from the structure than if only in cooling mode. The thermostat also allows for an additional overcooling limit setting from 0°F to 3°F

setup. This allows the cooling system to further reduce humidity by lowering the temperature up to 3°F below the cooling setpoint in an attempt to better achieve desired humidity levels.

#### DEHUMIDIFICATION TIPS\* (ComfortNet Systems Only)

For effective dehumidification operation:

- Ensure "Dehumidification" is not set to "OFF"
- Verify the cooling airflow profile (cool profiles) is set to "Profile D".
  - See the Cool Set-up section of the Installation Manual for complete airflow profile details.
  - By default, "dehumidification selection" is standard and the cooling airflow profile is set to "Profile D".
- For additional dehumidification control, airflow settings are field adjustable and can be fine-tuned to a value that is comfortable for the application from a range of Cool Airflow Trim.
- In addition, the system can have Enhanced Dehumidification operation in setting "A", "B", or "C" of dehumidification based on dehumidification demand.
- See the Dehumidification Select section for more detail.

#### COMFORTBRIDGE™ SYSTEM OVERVIEW

The ComfortBridge based inverter heating and air conditioning system uses an indoor unit and outdoor unit digitally communicating with one another via a two-way communications path.

The 24 VAC single-stage thermostat sends commands to the indoor and outdoor units.

The indoor and outdoor units interacting with one another directly while taking simple analog commands from the thermostat are the core of unlocking the benefits and features of the ComfortBridge control system.

**NOTE:** It is strongly recommend the use of thermostat with humidity sensor and dehumidification terminal. Without these functions, dehumidification operation does not work.

#### COMFORTBRIDGE SYSTEM ADVANCED FEATURES

The ComfortBridge system permits access to additional system information, advanced set-up features, and advanced diagnostic/troubleshooting features via the control board push buttons or the CoolCloud mobile app.

#### FAULT CODE HISTORY

The Air Conditioner's diagnostics menu provides access to the most recent faults. The six most recent faults can be accessed through the control board seven segment displays or the CoolCloud mobile app. Any consecutively repeated fault is stored a maximum of three times.

**EXAMPLE:** A leak in the system, low refrigerant charge or an incompletely open stop valve can cause the unit to flash error code E15. This error code suggests that the unit is experiencing operation at low pressure. The control will only store this fault the first three consecutive times the fault occurs.

**NOTE:** The fault list can be cleared after performing maintenance or servicing the system to assist in the troubleshooting process.

#### **DEVICE STATUS**

This menu displays information about the systems current status. This menu can be utilized to confirm correct functionality of the equipment and for troubleshooting purposes.

The following items will be displayed:

- Heat Capacity Request Percentage
- Cool Capacity Request Percentage
- Heat Capacity Request During Defrost Percentage
- Dehumidification Request Percentage
- Reversing Valve Status
- Reported Airflow by Indoor Unit
- Boost Mode
- Previous Defrost Run Time

#### SENSOR DATA

The following sensor items will be displayed:

- Outdoor Temperature
- Coil Temperature
- Liquid Line Temperature
- Discharge Temperature
- Defrost Sensor
- Suction Pressure

#### **PUMP DOWN**

This function can be enabled this menu.

#### SET 7-SEGMENT MODE DISPLAY TO PUMP DOWN

Please follow the following sequence to enter PUMP DOWN to accumulate the refrigerant to outdoor unit by 7 Segment Mode. Do not operate COOL ON or HEAT ON mode to enter PUMP DOWN.

Before starting the PUMP DOWN operation, change indoor fan trim, delay and profile back to default and stop electric heater and gas furnace. Remove if no trim feature. In this operation, the gas and liquid service valve should be opened.

- Set 7-segment display to SCREEN 4 (SETTING MODE 2) Setting No. 8 and change the display from "-01" to "-00" System will then automatically start PUMP DOWN operation. For information on how to set 7-segment display, see the section SETTING THE MODE DISPLAY in this manual.
- 2. Approximately one minute later, the compressor should start operating. Check the amperage at the compressor wiring to see the compressor operation status. Unit display error code E11 (System verification Test) once the PUMP DOWN operations starts.
- 3. Close liquid service valve approximately two minutes after compressor has come on.
- Compressor will come to a stop automatically. Close the suction service valve immediately after the compressor stops. After completion of PUMP DOWN, unit shows error code"E11".

**NOTE:** Refrigerant cannot be collected to the outdoor unit completely if the system is overcharged or if there is a delay in closing the liquid service valve and suction service valve. Evacuate the left over refrigerant from the system using a recovery machine.

#### SYSTEM VERIFICATION TEST

The mandatory system verification test is enabled from this menu, which enables a functional check of the equipment, in addition to ensuring proper stop valve position.

#### COOL SET-UP

The system allows for the adjustment of several cooling performance variables. Cool Airflow Trim (\*1), Cool Airflow Profiles, Cool Fan ON Delay, Cool Fan OFF Delay and Dehumidification Select (some enable option or off) can be adjusted in this menu. You can also reset this entire menu to factory default settings.

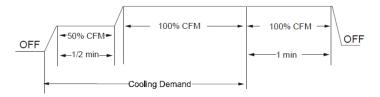

See the fol-lowing images showing the four cooling airflow profiles.

#### **COOLING AIRFLOW PROFILE**

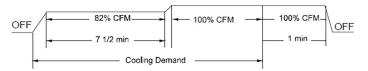

• Profile A provides only an OFF delay of one (1) minute at 100% of the cooling demand airflow.

 Profile B ramps up to full cooling demand airflow by first stepping up to 50% of the full demand for 30 seconds. The motor then ramps to 100% of the required airflow. A one (1) minute OFF delay at 100% of the cooling airflow.

 Profile C ramps up to 82% of the full cooling demand airflow and operates there for approximately 7 ½ minutes. The motor then steps up to the full demand airflow. Profile C also has a one (1) minute 100% OFF delay.

 Profile D (default) ramps up to 50% of the demand for ½ minute, then ramps to 82% of the full cooling demand airflow and operates there for approximately 7 ½ minutes. The motor then steps up to the full demand airflow. Profile D has a ½ minute at 50% airflow OFF delay.

#### **HEAT SET-UP**

This menu allows for the adjustment of several heating performance variables. Heat Airflow trim (\*1), Heat Fan ON Delay, Heat Fan OFF Delay and timed Defrost interval can be adjusted in this menu. Time interval of 30, 60, 90 and 120 minutes between two defrost cycles can be set to suit the weather conditions and performance of the unit.

# SET THERMOSTAT TO ADJUST INDOOR AIR CFM TRIM\*1

User can change the airflow trim at high, intermediate and low for cooling.

#### Select:

Cool/Heat Airflow Trim (High): high speed cooling/heating Cool/Heat Airflow Trim (Int): intermediate speed cooling/ heating Cool/Heat Airflow Trim (Low): low speed cooling/ heating Under each trim setting, the airflow can be increased or decreased by a certain percentage.

- \*1
- 1) At Cool and Heat Hi speed trim, \*SXV906010\*\* with \*\*VC960804C, \*\*VM970804C and \*MVC800804C combination trim more than 5% settings are invalid. Trimmed up CFM makes miss matching error.
- 2) At Cool Hi speed trim, Other than the above, depending on the connected indoor unit, there are restrictions on the positive side Trim setting.

If you want to change the Cool Airflow Trim to positive side, be sure to confirm the Airflow Trim restrictions in the latest indoor unit installation manual. The latest manual can be obtained from the website "Partner-Link(InfoFinderPlus/ Literature)". [PartnerLink URL]

https://partnerlinkmarketing.goodmanmfg.com/goodman/ info-finder-plus

3) At Cool Intermediate and Low speed trim, The Inverter system uses lower compressor speed and lower indoor unit CFM to optimize system performance. To obtain 100% CFM for home circulation, use full Trim setting instead of Int/Low speed. This is recommended for applications with unusually cold return temperatures such as basements.

#### **DEHUMIDIFICATION SELECT\***

When Dehumidification mode exists, the circulating fan output is reduced, increasing system run time, over cooling the evaporator coil and ultimately removing more humidity from the structure than if only in cooling mode.

The system can have Dehumidification operation in setting "Standard", "A", "B" or "C" of "dehumidify with cooling" menu based on dehumidification demand.

Setting "Standard" allows for the widest compressor operation range with lower CFM than Cooling mode.

In the Enhanced Dehumidification (setting A, B and C) the indoor airflow is lower than Standard Dehumidification (Standard).

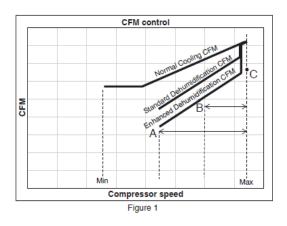

Setting "A" allows for the same compressor operation range in Dehumidification operation with lower CFM than standard dehumidification (Standard).

Setting "B" limits compressor operation range and keeps high dehumidification capacity.

In setting "C" the system runs fixed at 100% compressor and airflow. See Figure 1.

**NOTE:** In high humidity environments, sweating on supply ducts, cased coils or air handler cabinets can become an issue in Enhanced Dehumidification operation. It is strongly recommended covering then with 2" fiberglass insulation for these installations.

For details, see the Installation Manual or Service Manual that matches the Major and Minor revision of model name.

# MAX COMPRESSOR RPS FOR COOLING/HEATING (SELECTED RPS/ RPS range)

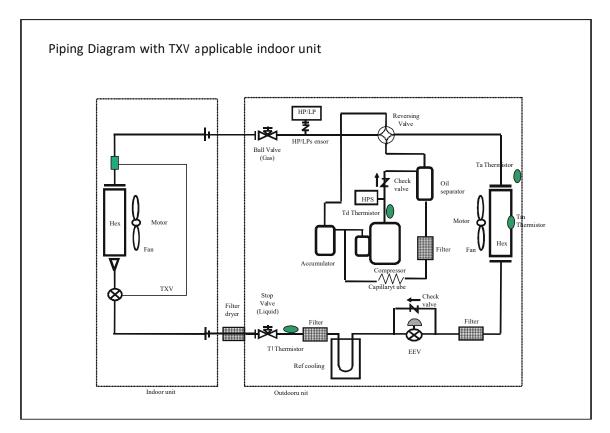

Max compressor speed at which the outdoor unit will operate can be changed through the control board seven segment displays or the CoolCloud mobile app.

Max compressor speed can be changed to get the required capacity or efficiency.

Once the maximum speed is set, the system operates between the set maximum speed and default low speed.

When determining the appropriate compressor speed for cooling and heating, in the "RPS Range For Cooling/ Heating" menu select the range that contains the desired value. (Then, after pressing the Apply Changes button, leave the Device setting menu and enter this menu again. Otherwise, the changed settings will not be reflected.) Next, in the "Selected RPS for Cooling/Heating" menu, select the desired RPS within the displayed range.

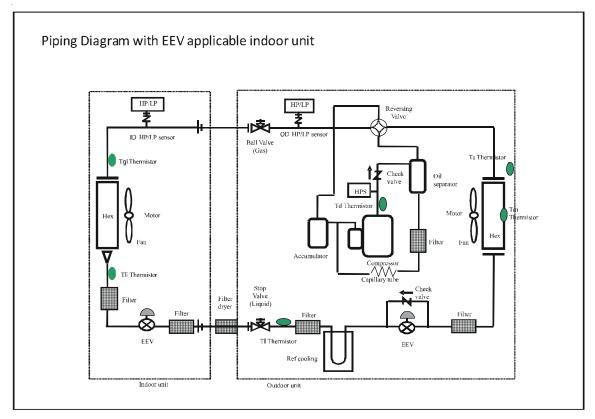

### **COOLING CYCLE**

- ID HP/LP sensor = Indoor High/Low Pressure Sensor
- OD HP/LP sensor = Outdoor High/Low Pressure Sensor HPS = High Pressure Switch

#### CHECKING VOLTAGE

1. Remove outer case, control panel cover, etc., from unit being tested.

With power ON:

2. Using a voltmeter, measure the voltage across terminals L1 and L2 of the contactor for the Air Conditioner condenser unit or at the field connections for the air handler or heaters.

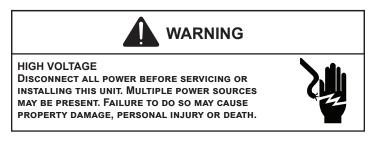

**ComfortNet™ Ready Air Conditioner Condenser Units:** Measure the voltage across the L1 and L2 lugs on the unitary (UC) control.

- 3. No reading indicates open wiring, open fuse(s) no power or etc., from unit to fused disconnect service. Repair as needed.
- 4. With ample voltage at line voltage connectors, energize the unit.

Unit Type	Unit Su	pply Voltag	ge (VAC)
Shit Type	voltage	min.	max.
Outdoor Unit, Air Handler, Modular Blower, Heater Kit	208/230	197	253
Gas Furnaces	115	103	126

**NOTE:** When operating electric heaters on voltages other than 240 volt, refer to the System Operation section on electric heaters to calculate temperature rise and air flow. Low voltage may cause insufficient heating.

#### **CHECKING WIRING**

- 1. Check wiring visually for signs of overheating, damaged insulation and loose connections.
- 2. Use an ohmmeter to check continuity of any suspected open wires.
- 3. If any wires must be replaced, replace with comparable gauge and insulation thickness.

#### CHECKING THERMOSTAT AND WIRING

Communicating Thermostat Wiring: The maximum wire length for 18 AWG thermostat wire is 250 feet.

#### THERMOSTAT AND WIRING

LINE VOLTAGE NOW PRESENT.

With power ON, thermostat calling for cooling/heating.

- 1. Use a voltmeter to check for 24 volt at thermostat wires C and R in the indoor unit control panel.
- 2. No voltage indicates trouble in the thermostat, wiring or transformer source.
- 3. Check the continuity of the thermostat and wiring. Repair or replace as necessary.

LINE VOLTAGE NOW PRESENT.

#### **RESISTANCE HEATERS**

With power ON:

- 1. Set room thermostat to a higher setting than room temperature so both stages call for heat.
- 2. With voltmeter, check for 24 volt at each heater relay.
- 3. No voltage indicates the trouble is in the thermostat or wiring.
- 4. Check the continuity of the thermostat and wiring. Repair or replace as necessary.

**NOTE:** Consideration must be given to how the heaters are wired (O.D.T. and etc.). Also safety devices must be checked for continuity.

#### THERMOSTAT COMFORTBRIDGE™ SYSTEM

#### OVERVIEW

The ComfortBridge based inverter heating and air conditioning system uses an indoor unit and outdoor unit digitally communicating with one another via a two-way communications path.

The 24 VAC single-stage thermostat sends commands to the indoor and outdoor units.

The indoor and outdoor units interacting with one another directly while taking simple analog commands from the thermostat are the core of unlocking the benefits and features of the ComfortBridge control system.

**NOTE:** It is **<u>strongly</u>** recommend the use of thermostat with humidity sensor and dehumidification terminal. Without these functions, Dehumidification operation does not work.

#### COMFORTBRIDGE™ SYSTEM WIRING

ComfortBridge<sup>™</sup> control system is low voltage wiring consists of two wires between the indoor unit and outdoor unit.

The required wires are data lines 1 and 2.

The thermostat needs 4 wires between the indoor unit and thermostat or 5 wires if the thermostat requires a Common wire.

**NOTE:** Regarding the wiring of the indoor unit to the thermostat, also refer to ComfortBridge<sup>™</sup> compatible indoor unit's install manual (in case of communicating inverter system).

SYSTEM WIRING

#### CHECKING TRANSFORMER AND CONTROL CIRCUIT

A step-down transformer (208/230 volt primary to 24 volt secondary) is provided with each indoor unit. This allows ample capacity for use with resistance heaters. The outdoor sections do not contain a transformer (see note below). (see indoor unit WIRING DIAGRAM)

DISCONNECT ALL POWER BEFORE SERVICING.

1. Remove control panel cover, or etc., to gain access to transformer.

With power ON:

LINE VOLTAGE NOW PRESENT.

- 2. Using a voltmeter, check voltage across secondary voltage side of transformer (R to C).
- No voltage indicates faulty transformer, bad wiring, or bad splices.
- 4. Check transformer primary voltage at incoming line voltage connections and/or splices.
- 5. If line voltage available at primary voltage side of transformer and wiring and splices good, transformer is inoperative. Replace.

#### CHECKING HIGH PRESSURE SWITCH

HIGH VOLTAGE Disconnect all power before servicing or installing this unit. Multiple power sources may be present. Failure to do so may cause property damage, personal injury or death.

The high pressure switch senses the pressure in the compressor discharge line. If abnormally high condensing pressures develop, the contacts of the control open, breaking the control circuit before the compressor motor overloads. This control is automatically reset.

- 1. Using an ohmmeter, check across the X32A connection on outdoor unit PCB high pressure control, with wire removed. If not continuous, the contacts are open.
- 2. Attach a gauge to the dill valve port on the base valve.

With power ON:

LINE VOLTAGE NOW PRESENT.

- 3. Start the system in charge mode and place a piece of cardboard in front of the outdoor coil, raising the condensing pressure.
- 4. Check pressure at which the high pressure control cutsout. If it cuts-out at 605 PSIG to -17 PSIG, it is operating normally (See causes for high head pressure in Service Problem Analysis Guide). If it cuts out below this pressure range, replace the control.

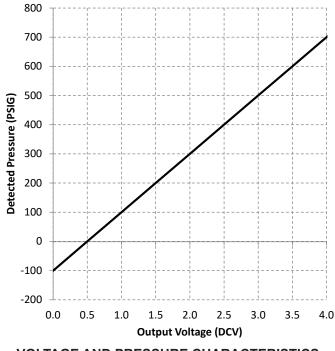

#### CHECKING OUTDOOR HI/LOW PRESSURE SENSOR

LINE VOLTAGE NOW PRESENT.

The HI/LOW pressure sensor senses the suction pressure in cooling mode, and the discharge pressure in heating mode. Follow the following sequence to check the pressure sensor.

- 1. Connect manifold gauge to the air conditioner unit
- 2. Connect a pair of extended Molex probe tips to your voltmeter test leads.
- 3. Find the suction pressure in the cool mode, or discharge pressure in the heat mode. Locate (X17A) connection and connect a DC voltmeter across sensor terminals 1 and 3, (black and white wires) and record the DC voltage.
- 4. Compare your readings to the detected pressure vs output voltage in the following table. Replace the sensor if the sensor is open, shorted, or outside of the voltage range.

**VOLTAGE AND PRESSURE CHARACTERISTICS** 

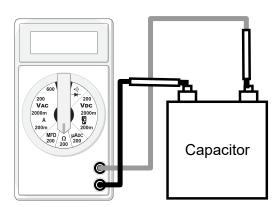

#### **RESISTANCE CHECK (5 TON ONLY)**

1. Discharge capacitor and remove wire leads.

DISCHARGE CAPACITOR THROUGH A 20 TO 30 OHM RESISTOR BEFORE HANDLING.

WARNING

#### **TESTING CAPACITOR RESISTANCE**

- 2. Set an ohmmeter on its highest ohm scale and connect the leads to the capacitor.
  - A. Good Condition indicator swings to zero and slowly returns to infinity. (Start capacitor with bleed resistor will not return to infinity. It will still read the resistance of the resistor).
  - B. Shorted indicator swings to zero and stops there replace.
  - C. Open no reading replace. (Start capacitor would read resistor resistance.)

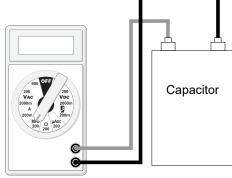

#### **CAPACITANCE CHECK (5 TON ONLY)**

Using a hookup as shown below, take the amperage and voltage readings and use them in the formula:

Capacitance (MFD) = 2650 X Amperage Voltage

DISCHARGE CAPACITOR THROUGH A 20 TO 30 OHM RESISTOR BEFORE HANDLING.

TESTING CAPACITANCE

#### CHECKING COMPRESSOR

# 

HERMETIC COMPRESSOR ELECTRICAL TERMINAL VENTING CAN BE DANGEROUS. WHEN INSULATING MATERIAL WHICH SUPPORTS A HERMETIC COMPRESSOR OR ELECTRICAL TERMINAL SUDDENLY DISINTEGRATES DUE TO PHYSICAL ABUSE OR AS A RESULT OF AN ELECTRICAL SHORT BETWEEN THE TERMINAL AND THE COMPRESSOR HOUSING, THE TERMINAL MAY BE EXPELLED, VENTING THE VAPOR AND LIQUID CONTENTS OF THE COMPRESSOR HOUSING AND SYSTEM.

If the compressor terminal PROTECTIVE COVER and gasket (if required) are not properly in place and secured, there is a remote possibility if a terminal vents, that the vaporous and liquid discharge can be ignited, spouting flames several feet, causing potentially severe or fatal injury to anyone in its path.

This discharge can be ignited external to the compressor if the terminal cover is not properly in place and if the discharge impinges on a sufficient heat source.

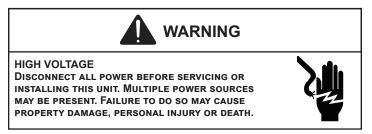

Ignition of the discharge can also occur at the venting terminal or inside the compressor, if there is sufficient contaminant air present in the system and an electrical arc occurs as the terminal vents.

Ignition cannot occur at the venting terminal without the presence of contaminant air, and cannot occur externally from the venting terminal without the presence of an external ignition source.

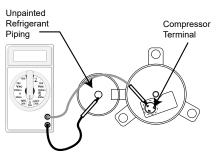

Therefore, proper evacuation of a hermetic system is essential at the time of manufacture and during servicing. To reduce the possibility of external ignition, all open flame, electrical power, and other heat sources should be extinguished or turned off prior to servicing a system.

#### COMPRESSOR WINDING INSULATION TEST

The Inverter on the outdoor control board takes the position signal from the UVW line, connected with the compressor. If the system detects a malfunction on the compressor, check the insulation resistance in accordance with the following procedure.

- 1. Remove the leads from the compressor terminals.
- 2. Using a Megometer, attach one lead to ground.
- 3. Using the other lead of the Megometer, check the insulation between U to ground, V to ground, W to ground.

#### **TESTING COMPRESSOR WINDINGS INSULATION**

**NOTE:** The 2, 3, and 4 ton compressor has a terminal on the top. The 5 ton compressor has the terminals on the side. If the insulation resistance of the compressor is less than 100k Ohms between U to ground, V to ground, W to ground, replace the compressor.

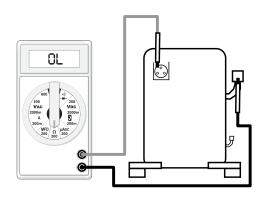

#### **GROUND TEST**

If fuse, circuit breaker, ground fault protective device, etc., has tripped, this is a strong indication that an electrical problem exists and must be found and corrected. The circuit protective device rating must be checked, and its maximum rating should coincide with that marked on the equipment nameplate.

With the terminal protective cover in place, it is acceptable to replace the fuse or reset the circuit breaker ONE TIME ONLY to see if it was just a nuisance opening. If it opens again, DO NOT continue to reset.

Disconnect all power to unit, making sure that all power legs are open.

- 1. DO NOT remove protective terminal cover. Disconnect the three leads going to the compressor terminals at the nearest point to the compressor.
- Identify the leads and using an ohmmeter on the R x 10,000 scale or the highest resistance scale on your ohmmeter check the resistance between each of the three leads separately to ground (such as an unpainted tube on the compressor).
- 3. If a ground is indicated, then carefully remove the compressor terminal protective cover and inspect for loose leads or insulation breaks in the lead wires.
- 4. If no visual problems indicated, carefully remove the leads at the compressor terminals.
- 5. Carefully retest for ground, directly between compressor terminals and ground.
- If ground is indicated, replace the compressor. The resistance reading should be infinity. If there is any reading on meter, there is some continuity to ground and compressor should be considered defective.

#### **TESTING CRANKCASE HEATER (5 TON ONLY)**

The crankcase heater must be energized a minimum of 2 hours before the unit is operated. Crankcase heaters are used to prevent migration or accumulation of refrigerant in the compressor crankcase during the off cycles and prevents liquid slugging or oil pumping on start up. A crankcase heater will not prevent compressor damage due to a flood-back or over charge condition.

- 1. Disconnect the heater lead in wires.
- 2. Using an ohmmeter, check heater continuity should test continuous. If not, replace.

**NOTE:** The positive temperature coefficient crankcase heater is a 33 watt 240 voltage heater. The cool resistance of the heater will be approximately 1745 ohms. The resistance will become greater as the temperature of the compressor shell increases.

# TESTING TEMPERATURE SENSORS AND EEV COIL RESISTANCE

The \*SXV9 outdoor units and AMVE\*\* indoor units are factory equipped with:

- (Ta) an outdoor air temperature sensor
- (Tm) an outdoor coil temperature sensor
- (TI) an outdoor liquid temperature sensor
- (Td) a discharge temperature sensor
- (Tgi) an indoor gas temperature sensor
- (Tli) an indoor liquid temperature sensor

#### To check above sensors:

#### WARNING

#### HIGH VOLTAGE

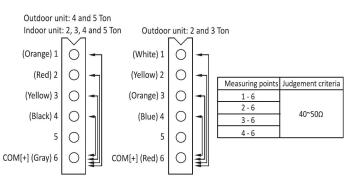

DISCONNECT ALL POWER BEFORE SERVICING OR INSTALLING THIS UNIT. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

- 1. Disconnect power to the Air Conditioner condensor.
- 2. Disconnect the sensor from the electric board.
- 3. Connect an ohmmeter across the sensor terminals. The ohmmeter should read be the resistance shown in the table THERMISTOR RESISTANCE AND TEMPERA-TURE CHARACTERISTICS CHART (page 31). Replace the sensor if the sensor is open, shorted, or outside the valid resistance range.

#### **TESTING EEV COIL RESISTANCE**

To check the resistance of the EEV coil, first disconnect EEV cable from the PCB board. Make measurements of resistance between the connector pins, and then make sure the resistance falls in the range of 40 to 50  $\Im$ .

#### AMVE HEATER CONTROL (OPTIONAL)

#### DESCRIPTION

The AMVE models utilize an electronic control that provides ECM blower motor control and control of up to two electric heat sequencers. The control has thermostat inputs for up to two stages of cooling, two stages of electric heat, reversing valve, and dehumidification. Control input is 24VAC.

#### TROUBLESHOOTING

#### MOTOR CONTROL CIRCUITS

1. Turn on power to air handler or modular.

LINE VOLTAGE NOW PRESENT.

 Check voltage between pins 1 and 4 at the 4-wire motor connector on the control board. Voltage should be between 9 and 15 VDC. Replace control if voltage is not as specified.

#### ELECTRIC HEAT SEQUENCER OUTPUTS

1. Turn on power to air handler or modular blower.

LINE VOLTAGE NOW PRESENT.

- 2. Disconnect the 4-circuit harness connecting the control to the electric heater kit.
- 3. Provide a thermostat demand for low stage auxiliary heat. Measure the voltage between pins 1 and 3 at the onboard electric heat connector. Voltage should measure 24VAC. Replace control if no voltage is present.

**NOTE:** Allow for any built-in time delays before making voltage measurements. Any electric heater faults that are present may prevent the heater output from energizing. Verify that no heater faults are present before making voltage measurements.

4. Provide a thermostat demand for high stage auxiliary heat (W1 + W2). Measure the voltage between pins 1 and 3 at the on-board electric heat connector. Measure the voltage between pins 2 and 3 at the on-board electric heat connector. Voltage should measure 24VAC. Replace control if no voltage is present.

The integrated air handler control has some on-board tools that may be used to troubleshoot the network. These tools are: red communications LED, green receive (Rx) LED, and learn button. These are described below

 Red communications LED – Indicates the status of the network. Refer to the Network Troubleshooting Chart for the LED status and the corresponding potential problem.

- b. Green receive LED Indicates network traffic. Refer to the Network Troubleshooting Chart for the LED status and the corresponding potential problem.
- c. Learn button Used to reset the network. Depress the button for approximately 2 seconds to reset the network.

For details, see NETWORK TROUBLESHOOTING section.

DISCONNECT ALL POWER BEFORE SERVICING.

#### **REFRIGERATION REPAIR PRACTICE**

ALWAYS REMOVE THE REFRIGERANT CHARGE IN A PROPER MANNER BEFORE APPLYING HEAT TO THE SYSTEM.

#### When repairing the refrigeration system:

#### HIGH VOLTAGE

DISCONNECT ALL POWER BEFORE SERVICING OR INSTALLING THIS UNIT. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

- 1. Never open a system that is under vacuum. Air and moisture will be drawn in.
- 2. Plug or cap all openings.
- 3. Remove all burrs and clean the brazing surfaces of the tubing with sand cloth or paper. Brazing materials do not flow well on oxidized or oily surfaces.
- 4. Clean the inside of all new tubing to remove oils and pipe chips.
- 5. When brazing, sweep the tubing with dry nitrogen to prevent the formation of oxides on the inside surfaces.
- 6. Complete any repair by replacing the liquid line drier in the system, evacuate and charge.

#### BRAZING MATERIALS

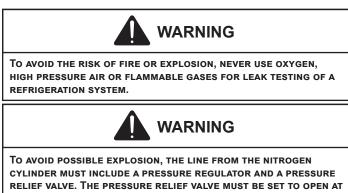

**IMPORTANT NOTE:** Torch heat required to braze tubes of various sizes is proportional to the size of the tube. Tubes of smaller size require less heat to bring the tube to brazing temperature before adding brazing alloy. Applying too much heat to any tube can melt the tube. Service personnel must use the appropriate heat level for the size of the tube being brazed.

**NOTE:** The use of a heat shield when brazing is recommended to avoid burning the serial plate or the finish on the unit. Heat trap or wet rags should be used to protect heat sensitive components such as stop valves, EEV, TXV and filters.

Copper to Copper Joints - Sil-Fos used without flux (allov of 15% silver, 80% copper, and 5% phosphorous). Recommended heat 1400°F.

Copper to Steel Joints - Silver Solder used without a flux (alloy of 30% silver, 38% copper, 32% zinc). Recommended heat - 1200°F.

#### LEAK TESTING (NITROGEN OR NITROGEN-TRACED)

NO MORE THAN 450 PSIG.

#### LEAK TESTING

Leak test the system using dry nitrogen and soapy water to identify leaks. If you prefer to use an electronic leak detector, charge the system to **10 PSIG** with the appropriate system refrigerant (see Serial Data Plate for refrigerant identification). Do not use an alternative refrigerant. Using dry nitrogen finish charging the system to 450 PSIG. Apply the leak detector to all suspect areas. When leaks are discovered, repair the leaks, and repeat the pressure test. If leaks have been eliminated proceed to system evacuation.

#### STANDING PRESSURE TEST

Using dry nitrogen, pressurize the system to 450 PSIG. Allow the pressure to stabilize and hold for 15 minutes (minimum). If the pressure does not drop below 450 PSIG the system is considered leak free. Proceed to system evacuation using the Deep Vacuum Method. If after 15 minutes the pressure drops below 450 PSIG follow the procedure outlined below to identify system leaks. Repeat the Standing Pressure Test.

#### SYSTEM EVACUATION

**REFRIGERANT UNDER PRESSURE!** 

FAILURE TO FOLLOW PROPER PROCEDURES MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

**IMPORTANT NOTE:** Because of the potential damage to compressors, do not allow suction pressure at service valve to drop below 5 PSIG when pumping unit system down for repair. Outdoor section, depending on line set length and amount of charge in system, may not be able to hold the entire system charge.

This is the most important part of the entire service procedure. The life and efficiency of the equipment is dependent upon the thoroughness exercised by the serviceman when evacuating air (non-condensables) and moisture from the system.

Air in a system causes high condensing temperature and pressure, resulting in increased power input and reduced performance.

Moisture chemically reacts with the refrigerant oil to form corrosive acids. These acids attack motor windings and parts, causing breakdown.

The equipment required to thoroughly evacuate the system is a vacuum pump, capable of producing a vacuum equivalent to 500 microns absolute and a micron gauge to give a true reading of the vacuum in the system

NOTE: Never use the system compressor as a vacuum pump or run when under a high vacuum. Motor damage could occur.

Condensing unit liquid and suction valves are closed to contain the charge within the unit. The unit is shipped with the valve stems closed and caps installed. Do not open valves until the system is evacuated.

#### **DEEP VACUUM METHOD**

The Deep Vacuum Method requires a vacuum pump rated for 500 microns or less. This method is an effective and efficient way of assuring the system is free of non-condensable air and moisture. As an alternative, the Triple Evacuation Method may be used.

It is recommended to remove the Schrader Cores from the service valves using a core-removal tool to expedite the evacuation procedure.

Connect the vacuum pump, micron gauge, and vacuum rated hoses to both service valves. Evacuation must use both service valves to eliminate system mechanical seals. Evacuate the system to less than 500 microns.

Isolate the pump from the system and hold vacuum for 10 minutes (minimum). Typically, pressure will rise slowly during this period. If the pressure rises to less than 1000 microns and remains steady, the system is considered leakfree; proceed to system charging and startup.

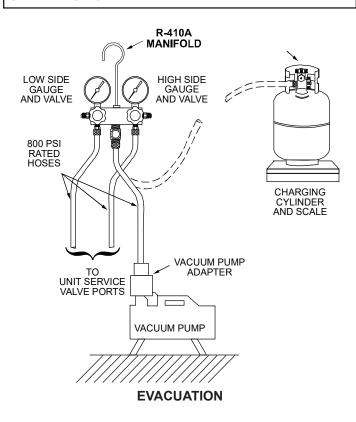

If pressure rises above 1000 microns but holds steady below 2000 microns, non-condensable air or moisture may remain or a small leak is present. Return to step 2: If the same result is achieved check for leaks and repair. Repeat the evacuation procedure.

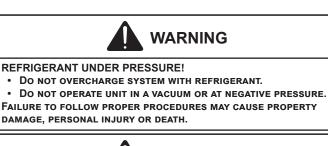

If pressure rises above 2000 microns, a leak is present. Check for leaks and repair. Repeat the evacuation procedure

# TRIPLE EVACUATION METHOD (ALTERNATE TO DEEP VACUUM METHOD)

- 1. Evacuate the system to 4000 microns and hold for 15 minutes. Then, break the vacuum with dry nitrogen, bring the system pressure up to 2-3 PSIG, and hold for 20 minutes. Release the nitrogen.
- 2. Evacuate to 1500 microns and hold for 20 minutes. Break the vacuum with dry nitrogen again, bring the system pressure back up to 2-3 PSIG, and hold for 20 minutes.
- 3. Then, evacuate the system until it is below 500 microns and hold for 60 minutes.

Do not front seat the service valve(s) with the compressor open, with the suction line of the compressor closed or severely restricted.

**CHARGING** 

Use refrigerant certified to AHRI standards. Used refrigerant may cause compressor damage and is not covered by the warranty. Most portable machines cannot clean used refrigerant to meet AHRI standards.

DAMAGE TO THE UNIT CAUSED BY OPERATING THE COMPRESSOR WITH THE SUCTION VALVE CLOSED IS NOT COVERED UNDER THE WARRANTY AND MAY CAUSE SERIOUS COMPRESSOR DAMAGE.

Charge the system with the exact amount of refrigerant. See the Installation Manual for the correct refrigerant charge.

An inaccurately charged system will cause future problems.

- 1. When using an ambient compensated calibrated charging cylinder, allow liquid refrigerant only to enter the high side.
- 2. Once the system stops taking refrigerant, close the valve on the high side of the charging manifold.
- 3. Start the system and charge the balance of the refrigerant through the low side.

**NOTE:** R410A should be drawn out of the storage container or drum in liquid form due to its fractionation properties, but should be "Flashed" to its gas state before entering the system. There are commercially available restriction devices that fit into the system charging hose set to accomplish this. DO NOT charge liquid R410A into the compressor.

4. With the system still running, close the valve on the charging cylinder. At this time, you may still have some liquid refrigerant in the charging cylinder hose and will definitely have liquid in the liquid hose. Reseat the liquid line core. Slowly open the high side manifold valve and transfer the liquid refrigerant from the liquid line hose and charging cylinder hose into the suction service valve port. CAREFUL: Watch so that liquid refrigerant does not enter the compressor.

#### FINAL CHARGE ADJUSTMENT

The outdoor temperature must be 65°F to 105°F. If outdoor ambient temperature is out of range, charge defined amount and don't adjust subcooling. Set the room thermostat to CHARGE mode.

After system has stabilized per startup instructions, check subcooling as detailed in the following section. In the event of system overcharge or undercharge, refrigerant in the system must be adjusted to the appropriate subcooling and superheat as specified in the following sections. Refrigerant amount should be adjusted within +/- 0.5 lb. if the outdoor ambient temperature is greater than 65°F and less than 105°F. Manufacturer recommends that the system should be evacuated and should be charged the initial refrigerant for given line length when the ambient temperature is less than 65°F and more than 105°F. Refer to the Installation Manual to calculate refrigerant amount.

- 5. With the system still running, remove hose and reinstall both valve caps.
- 6. Check system for leaks.

**NOTE:** Subcooling information is valid only while the unit is operating at 100% capacity or 100% of compressor speed in CHARGE MODE. Compressor speed is displayed under STATUS menu in the thermostat.

#### CHECKING COMPRESSOR EFFICIENCY

The reason for compressor inefficiency is that the compressor is broken or damaged, reducing the ability of the compressor to pump refrigerant vapor.

The condition of the compressor is checked in the following manner.

- 1. Attach gauges to the high and low side of the system.
- 2. Start the system and run CHARGE MODE.

If the test shows:

- a. Below normal high side pressure.
- b. Above normal low side pressure.
- c. Low temperature difference across coil.
- d. Low amp draw at compressor.

And the charge is correct. The compressor is faulty - replace the compressor.

#### THERMOSTATIC EXPANSION VALVE

The expansion valve is designed to control the rate of liquid refrigerant flow into an evaporator coil in exact proportion to the rate of evaporation of the refrigerant in the coil. The amount of refrigerant entering the coil is regulated since the valve responds to temperature of the refrigerant gas leaving the coil (feeler bulb contact) and the pressure of the refrigerant in the coil. This regulation of the flow prevents the return of liquid refrigerant to the compressor.

Some TXV valves contain an internal check valve thus eliminating the need for an external check valve and bypass loop. The three forces which govern the operation of the valve are: (1) the pressure created in the power assembly by the feeler bulb, (2) evaporator pressure, and (3) the equivalent pressure of the superheat spring in the valve. 0% bleed type expansion valves are used on indoor and outdoor coils. The 0% bleed valve will not allow the system pressures (High and Low side) to equalize during the shut down period. The valve will shut off completely at approximately 100 PSIG.

30% bleed valves used on some other models will continue to allow some equalization even though the valve has shutoff completely because of the bleed holes within the valve. This type of valve should not be used as a replacement for a 0% bleed valve, due to the resulting drop in performance.

The bulb must be securely fastened with two straps to a clean straight section of the suction line. Application of the bulb to a horizontal run of line is preferred. If a vertical installation cannot be avoided, the bulb must be mounted so that the capillary tubing comes out at the top.

THE VALVES PROVIDED BY THE MANUFACTURER ARE DESIGNED TO MEET THE SPECIFICATION REQUIRE-MENTS FOR OPTIMUM PRODUCT OPERATION. DO NOT USE SUBSTITUTES.

#### OVERFEEDING

Overfeeding by the thermostatic expansion valve results in high suction pressure, cold suction line, and possible liquid slugging of the compressor.

If these symptoms are observed:

- 1. Check for an overcharged unit by referring to the cooling performance charts in the servicing section.
- 2. Check the operation of the power element in the valve as explained in S-110 Checking Thermostatic Expansion Valve.
- 3. Check for restricted or plugged equalizer tube.

#### UNDERFEEDING

Underfeeding by the thermostatic expansion valve results in low system capacity and low suction pressures. If these symptoms are observed:

- 1. Check for a restricted liquid line or drier. A restriction will be indicated by a temperature drop across the drier.
- 2. Check the operation of the power element of the valve as described in S-110 Checking Thermostatic Expansion Valve Operation.

#### SUPERHEAT

The thermostatic expansion valve is factory adjusted to maintain  $8^{\circ}F \pm 1^{\circ}F$  degrees superheat of the suction gas. Before checking the superheat or replacing the valve, perform all the procedures outlined under Air Flow, Refrigerant Charge, Thermostatic Expansion Valve - Overfeeding, Underfeeding. These are the most common causes for evaporator malfunction.

#### **CHECKING SUPERHEAT**

Refrigerant gas is considered superheated when its temperature is higher than the saturation temperature corresponding to its pressure. The degree of superheat equals the degrees of temperature increase above the saturation temperature at existing pressure. See Temperature - Pressure Chart on following pages.

- 1. Run system at least 10 minutes to allow pressure to stabilize.
- 2. For best results, temporarily install a thermometer on the liquid line at the liquid line service valve and 4-6" from the compressor on the suction line. Ensure the thermometer makes adequate contact and is insulated for best possible readings. Use liquid line temperature to determine sub-cooling and vapor temperature to determine superheat.

**NOTE:** An optional method is to locate the thermometer at the suction line service valve. Ensure the thermometer makes adequate contact and is insulated for best possible readings.

3. Refer to the superheat table provided for proper system superheat. Add charge to lower superheat or recover charge to raise superheat.

#### Superheat Formula = Suct. Line Temp. - Sat. Suct.Temp.

#### EXAMPLE:

- a. Suction Pressure = 143 PSIG
- b. Corresponding Temp. =  $50^{\circ}$ F.
- c. Thermometer on Suction Line = 58°F.

To obtain the degrees temperature of superheat, subtract 50.0 from  $58.0^{\circ}$ F.

The difference is  $8^{\circ}$  Superheat. The  $8^{\circ}$  Superheat would fall in the ± range of allowable superheat.

#### **CHECKING SUBCOOLING**

Refrigerant liquid is considered subcooled when its temperature is lower than the saturation temperature corresponding to its pressure. The degree of subcooling equals the degrees of temperature decrease below the saturation temperature at the existing pressure.

- 1. Attach an accurate thermometer or preferably a thermocouple type temperature tester to the liquid service valve as it leaves the condensing unit.
- 2. Install a high side pressure gauge on the high side (liquid) service valve at the front of the unit.
- 3. Record the gauge pressure and the temperature of the line.

- 4. Review the technical information manual or specification sheet for the model being serviced to obtain the design subcooling.
- 5. Compare the hi-pressure reading to the "Required Liquid Line Temperature" chart. Find the hi-pressure value on the left column. Follow that line right to the column under the design subcooling value. Where the two intersect is the required liquid line temperature. Alternately you can convert the liquid line pressure

gauge reading to temperature by finding the gauge reading in the R-410A Pressure vs. Temperature Chart, find the temperature in the °F. Column.

6. The difference between the thermometer reading and pressure to temperature conversion is the amount of subcooling.

Add charge to raise subcooling. Recover charge to lower subcooling.

#### Subcooling Formula = Sat. Liquid Temp. - Liquid Line Temp.

NOTE: To adjust subcooling, follow the sequence of S-108.

#### EXAMPLE:

- a. Liquid Line Pressure = 417 PSIG
- b. Corresponding Temp. = 120°F.
- c. Thermometer on Liquid line = 109°F.

To obtain the amount of subcooling subtract 109°F from 120°F.

The difference is 11° subcooling. See the specification sheet or technical information manual for the design subcooling range for your unit.

There are other causes for high head pressure which may be found in the "Cooling / Heating Analysis Chart."

If other causes check out normal, an overcharge or a system containing non-condensables would be indicated. If this system is observed:

- 1. Start the system.
- 2. Remove and capture small quantities of gas from the suction line dill valve until the head pressure is reduced to normal.
- 3. Observe the system while running a cooling performance test. If a shortage of refrigerant is indicated, then the system contains non-condensables.

	Charging	Table	
OD Ambient Temp (degF)	<65°F	65°F to 105°F	>105°F
Subcooling (degF)	Weigh in Charge	2T to 5T:8°F ±1°F	Weigh in Charge

SUPERHEAT AND SUBCOOLING ADJUSTMENT ON TXV APPLICATIONS

**NOTE:** Subcooling and superheat information is valid only while the unit is operating at 100% capacity or 100% compressor speed in CHARGE MODE.

Compressor speed is displayed under STATUS menu in the thermostat.

- Run system at least 10 minutes to allow pressure to stabilize. During the adjustment of subcooling, ambient temperature should be greater than 65°F and less than 105°F. If ambient temperature is out of range, don't adjust subcooling.
- 2. For best results, temporarily install a thermometer on the liquid line at the liquid line service valve and 4-6" from the compressor on the suction line. Ensure the thermometer makes adequate contact and is insulated for best possible readings. Use liquid line temperature to determine sub-cooling and vapor temperature to determine superheat.

**NOTE:** An optional method is to locate the thermometer at the suction line service valve. Ensure the thermometer makes adequate contact and is insulated for best possible readings.

- 3. The system subcooling should be 8°F ± 1°F. If not in that range, adjust subcooling and superheat according to the following procedure.
  - a. If subcooling and superheat are low, adjust TXV to 7 to 9°F superheat, then check subcooling.
     NOTE: To adjust superheat, turn the valve stem clockwise to increase and counter clockwise to decrease.
  - b. If subcooling is low and superheat is 7 to 9°F, add charge to rise subcooling to 8°F ± 1°F, then check superheat.
  - c. If subcooling is low and superheat is high, add charge to rise subcooling to  $8^{\circ}F \pm 1^{\circ}F$ , then check superheat.
  - d. If subcooling is 8°F ± 1°F and superheat is high, adjust the TXV valve to 7 to 9°F superheat, then check subcooling.
  - e. If subcooling and superheat are high, adjust the TXV valve to 7 to 9°F superheat, then check subcooling.
  - f. If subcooling is high and superheat is 7 to  $9^{\circ}$ F, remove charge to lower the subcooling to  $8^{\circ}$ F ±  $1^{\circ}$ F, then check superheat.
  - g. If subcooling is high and superheat is low, adjust the TXV valve to 7 to 9°F superheat and remove charge to low the subcooling to 8°F ± 1°F.
  - h. If subcooling is  $8^{\circ}F \pm 1^{\circ}F$  and superheat is low, adjust the TXV valve to 7 to  $9^{\circ}F$  superheat and remove charge to lower the subcooling  $8^{\circ}F \pm 1^{\circ}F$ , then check the superheat.

**NOTE:** It is recommended to add charge in 4 oz. increments each time to achieve the target subcooling.

4. Disconnect manifold set. Installation is complete.

#### SUBCOOLING ADJUSTMENT ON EEV APPLICATIONS

**NOTE:** Subcooling information is valid only while the unit is operating at 100% capacity or 100% compressor speed in CHARGE MODE.

Compressor speed is displayed under STATUS menu in the thermostat.

- Run system at least 20 minutes to allow pressure to stabilize. During the adjustment of subcooling, ambient temperature should be greater than 65°F and less than 105°F. If ambient temperature is out of range, don't adjust subcooling.
- 2. For best results, temporarily install a thermometer on the liquid line at the liquid line service valve. Ensure the thermometer makes adequate contact and is insulated for best possible readings. Use liquid line temperature to determine sub-cooling.
- 3. The system subcooling should fall in the range shown in following table. If not in that range, adjust subcooling according to the following procedure.
  - a. If subcooling is low, add charge to adjust the subcooling to  $8^\circ F$   $\pm$   $1^\circ F.$
  - b. If subcooling is high, remove charge to lower the subcooling to specified range.

**NOTE:** It is recommended to add charge in 4 oz. increments each time to achieve the target subcooling.

4. Disconnect manifold set. Installation is complete.

# CHECKING THERMOSTATIC EXPANSION VALVE OPERATION

- 1. Remove the remote bulb of the thermostatic expansion valve from the suction line.
- 2. Start the system and cool the bulb in a container of ice water, closing the valve. As you cool the bulb, the suction pressure should fall and the suction temperature will rise.
- 3. Next warm the bulb in your hand. As you warm the bulb, the suction pressure should rise and the suction temperature will fall.
- 4. If a temperature or pressure change is noticed, the expansion valve is operating. If no change is noticed, the valve is restricted, the power element is faulty, or the equalizer tube is plugged.
- 5. Capture the charge, replace the valve and drier, evacuate and recharge.

#### NON-CONDENSABLES

If non-condensables are suspected, shut down the system and allow the pressures to equalize. Wait at least 15 minutes. Compare the pressure to the temperature of the coldest coil since this is where most of the refrigerant will be. If the pressure indicates a higher temperature than that of the coil temperature, non-condensables are present.

Non-condensables are removed from the system by first removing the refrigerant charge, replacing and/or installing liquid line drier, evacuating and recharging.

#### COMPRESSOR BURNOUT

When a compressor burns out, high temperature develops causing the refrigerant, oil and motor insulation to decompose forming acids and sludge.

If a compressor is suspected of being burned-out, attach a refrigerant hose to the liquid line dill valve and properly remove and dispose of the refrigerant.

**NOTICE:** Violation of EPA regulations may result in fines or other penalties.

Now determine if a burn out has actually occurred. Confirm by analyzing an oil sample using a Sporlan Acid Test Kit, AK-3 or its equivalent.

Remove the compressor and obtain an oil sample from the suction stub. If the oil is not acidic, either a burnout has not occurred or the burnout is so mild that a complete clean-up is not necessary.

If acid level is unacceptable, the system must be cleaned by using the clean-up drier method.

**NOTE:** The Flushing Method using R-11 refrigerant is no longer approved by Daikin Brand Heating-Cooling.

#### **REFRIGERANT PIPING**

The piping of a refrigeration system is very important in relation to system capacity, proper oil return to compressor, pumping rate of compressor and cooling performance of the evaporator. A bi-flow filter drier must be brazed on by the installer onsite. Ensure the bi-flow filter drier pain finish is intact after brazing. If the paint of the steel filter drier has been burned or chipped, repaint or treat with a rust preventative. The recommended location of the filter drier is before the expansion device at the indoor unit. The liquid line must be insulated if more than 50 ft. of liquid line will pass through an area that may reach temperatures of 30°F of higher than ambient in cooling mode and/or if the temperature inside the conditioned space may reach a temperature lower than ambient in heating mode. FVC oils maintain a consistent viscosity over a large temperature range which aids in the oil return to the compressor; however, there will be some installations which require oil return traps. These installations should be avoided whenever possible, as adding oil traps to the refrigerant lines also increases the opportunity for debris and moisture to be introduced into the system. Avoid long running traps in horizontal suction line.

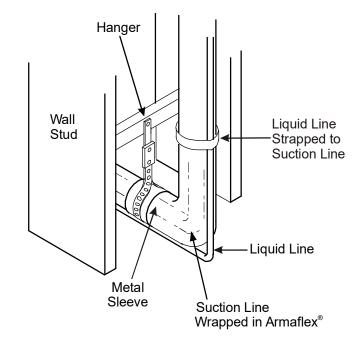

FIGURE 1-1. INSTALLATION OF REFRIGERATION PIPING FROM VERTICAL TO HORIZONTAL

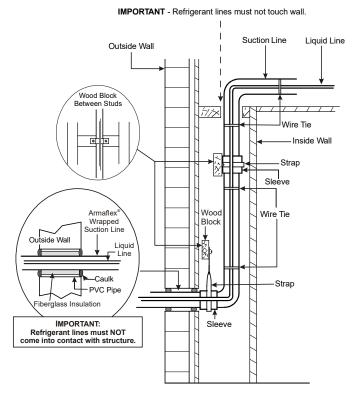

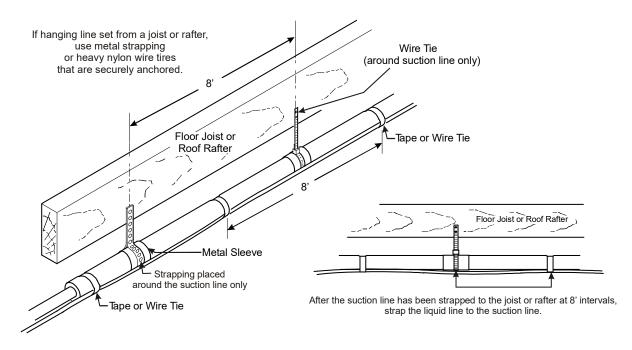

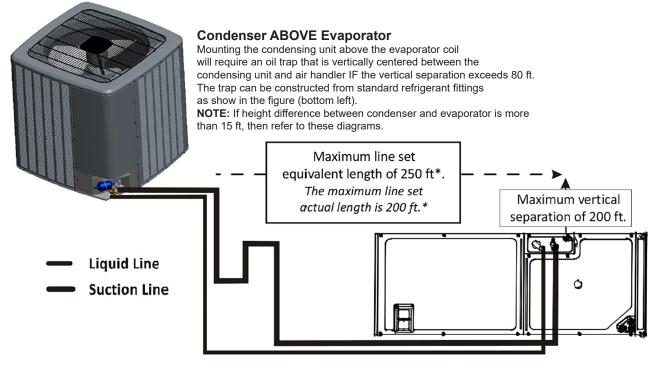

FIGURE 1-2. INSTALLATION OF REFRIGERANT PIPING (VERTICAL) NEW CONSTRUCTION SHOWN

**NOTE** If line set is installed on the exterior of an outside wall, similar installation practices are to be used.

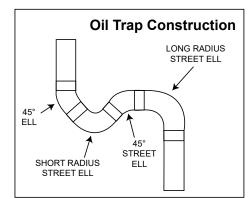

SECTION 3. OUTDOOR UNIT IS ABOVE THE INDOOR UNIT

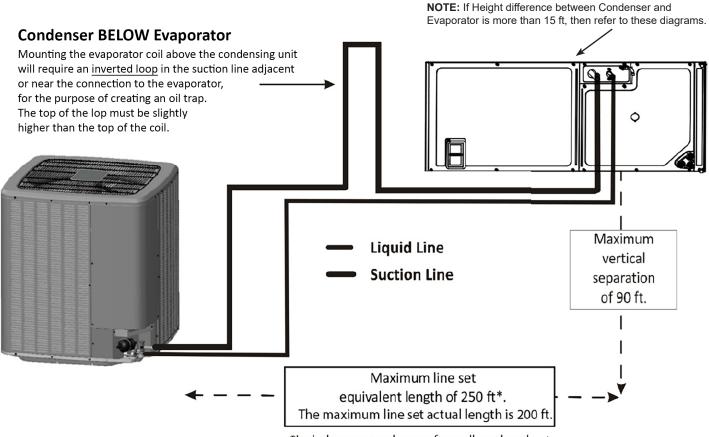

\*Accounts for pressure losses of any elbows. bends. etc.

- 1. Gas line must be sloped continuously towards the indoor unit.
- 2. The maximum elevation (vertical) difference between the outdoor unit and indoor unit is 200 feet.
- 3. The maximum line set equivalent length is 250 feet, which includes pressure losses of any elbow, bends, etc. The maximum line set actual length is 200 feet.
- 4. Inverted suction loop is not required at either unit.
- 5. An accumulator is not required for outdoor unit (accumulators are factory installed).

#### SECTION 4. OUTDOOR UNIT IS BELOW THE INDOOR UNIT

\*Includes pressure losses of any elbow, bends, etc.

1. The maximum elevation (vertical) difference between the outdoor unit and the indoor unit is 90 feet.

2. Suction line must be installed in a manner to prevent liquid migration to the outdoor unit from the indoor unit. The Air Conditioner condenser unit is shipped with a predetermined factory charge level as shown in the following chart. For longer line sets greater than 15 feet, add 0.6 ounces of refrigerant per foot.

NOTICE	
TOTAL REFRIGERANT =	
FACTORY CHARGE + (0.6 OZ./FT. * ADDITIONAL FEET	
OF ACTUAL LINE SET).	

# DUCT STATIC PRESSURES AND/OR STATIC PRESSURE DROP ACROSS COILS

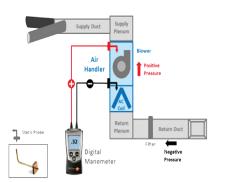

This minimum and maximum allowable duct static pressure for the indoor sections are found in the specifications section.

Tables are also provided for each coil, listing quantity of air (CFM) versus static pressure drop across the coil. Too great an external static pressure will result in insufficient air that can cause icing of the coil. Too much air can cause poor humidity control and condensate to be pulled off the indoor coil causing condensate leakage. Too much air can also cause motor overloading and in many cases this constitutes a poorly designed system.

#### AIR HANDLER EXTERNAL STATIC

To determine proper air movement, proceed as follows:

- 1. Using a draft gauge (inclined manometer), measure the static pressure of the return duct at the inlet of the unit, (Negative Pressure).
- 2. Measure the static pressure of the supply duct, (Positive Pressure).
- Add the two (2) readings together for total absolute value of external static pressure (for example, -0.30" wc +0.20" wc = 0.50" wc total static pressure).

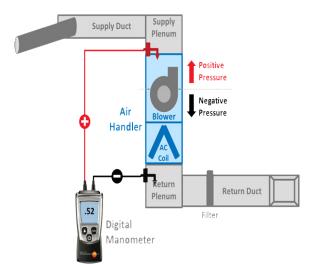

#### CHECKING STATIC PRESSURE ON TWO PIECE AIR HANDLER

- Measure the static pressure of the supply duct at the outlet of the unit
- Measure the static pressure between the outlet of the evaporator coil and the inlet of the air handler
- Since the evaporator coil is not part of the blower unit or furnace, <u>it must be not considered in calculating the</u> <u>static pressure of the blower unit or furnace</u>
- **NOTE:** Both readings may be taken simultaneously if so desired

**NOTE:** Both readings may be taken simultaneously and read directly on the manometer if so desired.

4. Consult proper table for quantity of air.

If external static pressure is being measured on a furnace to determine airflow, supply static must be taken between the "A" coil and the furnace.

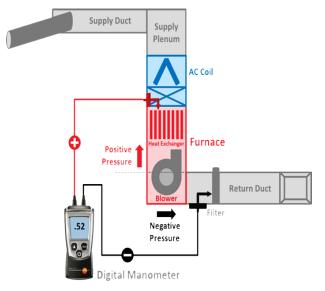

#### CHECKING STATIC PRESSURE SINGLE PIECE AIR HANDLER

- Measure the static pressure of the supply duct at the outlet of the air handler
- Measure the static pressure of the return duct at the inlet of the air handler
- Single piece air handler evaporator coil is already considered in airflow calculation
- NOTE: Both readings may be taken simultaneously and read if so desired

#### COIL STATIC PRESSURE DROP

- 1. Using a draft gauge (inclined manometer), connect the positive probe underneath the coil and the negative probe above the coil.
- 2. A direct reading can be taken of the static pressure drop across the coil.
- 3. Consult proper table for quantity of air.

#### CHECKING STATIC PRESSURE FURNACE

- Measure static pressure of the return duct at the inlet of the furnace
- Measure the static pressure of the supply duct at the outlet of the furnace
- **NOTE:** Both readings may be taken simultaneously and read if so desired

If the total external static pressure and/or static pressure drop exceeds the maximum or minimum allowable statics, check for closed dampers, dirty filters, undersized or poorly laid out duct work.

#### AIRFLOW CONSIDERATION

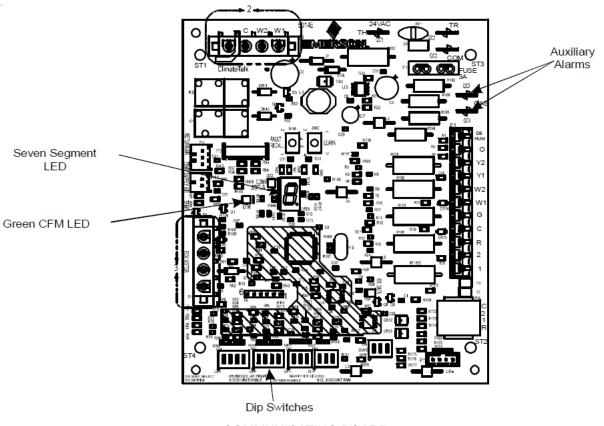

Airflow demands are managed differently in a fully communicating system than in a non-communicating wired system. The system operating mode (as determined by the thermostat) determines which unit calculates the system airflow demand. If the indoor unit is responsible for determining the airflow demand, it calculates the demand and sends it to the ECM motor. If the outdoor unit or thermostat is responsible for determining the demand, it calculates the demand and transmits the demand along with a fan request to the indoor unit. The indoor unit then sends the demand to the ECM motor. The table below lists the various communication systems, the operating mode, and airflow demand source.

System	System Operating Mode	Airflow Demand Source
	Cooling	Outdoor Unit
Any	Heat Pump Heating Only	Outdoor Unit
	Continuous Fan	Thermostat
Air Handler or Modular blower	HP + Electric Heat Strips	Either outdoor unit or indoor unit, which has higher Airflow demand
	Electric Heat Strips Only	Indoor Unit
Gas Furnace	Combustion Heat	Indoor Unit

For example, assume the system is an outdoor unit matched with an indoor unit. With a call for cooling, the outdoor unit will calculate the system's cooling airflow demand. The outdoor unit will then send a fan request along with the cooling airflow demand to the indoor unit. Once received, the indoor unit will send the cooling airflow demand to the ECM motor. The ECM motor then delivers the cooling airflow.

In continuous fan mode, the communicating thermostat provides the airflow demand. The communicating provides 4 continuous fan speeds (25%, 50%, 75% and 100% of maximum airflow). During continuous fan operation, the thermostat sends a fan request along with the continuous fan demand to the indoor unit. The indoor unit, in turn, sends the demand to the ECM motor. The ECM motor delivers the requested continuous fan airflow.

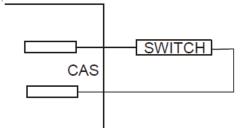

INDOOR UNIT TROUBLESHOOTING FOR TXV APPLICABLE UNIT (MBVC\*\*00AA-1)

COMMUNICATING BOARD

#### **AUXILIARY ALARM SWITCH**

The control is equipped with two Auxiliary Alarm terminals, labeled CAS, which are typically utilized in series with a condensate switch but could also be used with compatible CO2 sensors or fire alarms.

This feature can be activated or deactivated through the thermostat user menus. The auxiliary alarm switch must be normally closed and open when the alarm occurs. For example, a normally closed condensate switch will open when the base pan's water level reaches a particular level. The control will respond by turning off the blower motor and outdoor unit and displaying the proper fault codes. If the switch is later detected closed for 30 seconds, normal operation resumes and the error message is removed. The error will be maintained in the equipment's fault history. See FIGURE 15 on the following page for the connection location.

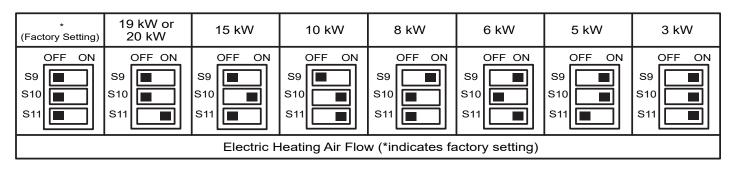

#### CIRCULATOR BLOWER

This air handler is equipped with a variable speed circulator blower. This blower provides several automatically-adjusted blower speeds. The Specification Sheet applicable to your model provides an airflow table, showing the relationship between airflow (CFM) and external static pressure (E.S.P.). The electric heat dip switch default position is set to the OFF, OFF, OFF position and should be adjusted by the installer to match the installation requirements for the correct electric heating CFM.

Using the Electric Heat Airflow table below, set dip switches 9, 10, and 11 for the installed heater kit. Verify selected CFM by counting the green CFM LED blinks. The green CFM LED blinks once for each 100 CFM of airflow. If an electric heater kit has not been installed, set dip switches 9, 10, and 11 to any appropriate heater kit setting (see next page table for valid settings).

During the cooling operation, the outdoor unit will determine the indoor airflow.

INDOOR UNIT TROUBLESHOOTING FOR TXV APPLICABLE UNIT (MBVC\*\*00AA-1)

**NOTE:** Upon start up in communicating mode the circuit board may display an "Ec" error. This is an indication that the dip switches on the control board need to be configured in accordance with the Electric Heating Airflow Table. Configuring the dip switches and resetting power to the unit will clear the error code.

#### TROUBLESHOOTING

#### **ELECTROSTATIC DISCHARGE (ESD) PRECAUTIONS**

**NOTE:** Discharge body's static electricity before touching unit. An electrostatic can adversely affect electrical components.

Use the following precautions during air handler installation and servicing to protect the integrated control module from damage. By putting the air handler, the control, and the person at the same electrostatic potential, these steps will help avoid exposing the integrated control module to electrostatic discharge. This procedure is applicable to both installed and uninstalled (ungrounded) blowers.

- Disconnect all power to the blower. Do not touch the integrated control module or any wire connected to the control prior to discharging your body's electrostatic charge to ground.
- 2. Firmly touch a clean, unpainted, metal surface of the air handler blower near the control. Any tools held in a person's hand during grounding will be discharged.
- 3. Service integrated control module or connecting wiring following the discharge process in step 2. Use caution not to recharge your body with static electricity; (i.e., do not move or shuffle your feet, do not touch ungrounded objects, etc.). If you come in contact with an ungrounded object, repeat step 2 before touching control or wires.
- 4. Discharge your body to ground before removing a new control from its container. Follow steps 1 through 3 if installing the control on a blower. Return any old or new controls to their containers before touching any ungrounded object.

#### **DIAGNOSTIC CHART**

DISCONNECT ALL POWER BEFORE SERVICING OR INSTALLING THIS UNIT. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

Refer to the Troubleshooting Chart at the end of this manual for assistance in determining the source of unit operational problems. The 7 segment LED display will provide any active fault codes. An arrow printed next to the display indicates proper orientation (arrow points to top of display). See following image.

#### FAULT RECALL

The integrated control module is equipped with a momentary push-button switch that can be used to display the last six faults on the 7 segment LED display. The control must be in Standby Mode (no thermostat inputs) to use the feature. Depress the push-button for approximately two seconds. The LED display will then display the six most recent faults beginning with the most recent fault and decrementing to the least recent fault. The faults may be cleared by depressing the button for greater than five seconds.

**NOTE:** Consecutively repeated faults are displayed a maximum of three times. Example: A clogged return air filter causes the air handler's motor to repeatedly enter a limiting condition. The control will only store this fault the first three consecutive times the fault occurs.

TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

#### HIGH VOLTAGE

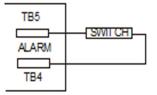

DISCONNECT ALL POWER BEFORE SERVICING OR INSTALLING THIS UNIT. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

#### INDOOR UNIT CONTROL BOARD

#### **AUXILIARY ALARM SWITCH**

The control is equipped with two Auxiliary Alarm terminals, labeled TB4 and TB5, which are typically utilized in series with a condensate switch but could also be used with compatible CO2 sensors or fire alarms.

The auxiliary alarm switch must be normally closed and open when the alarm occurs. For example, a normally closed condensate switch will open when the base pan's water level reaches a particular level. The control will respond by turning off the blower motor and displaying the proper fault codes. If the switch is later detected closed for 30 seconds, normal operation resumes and the error message is removed. The switch is closed as part of the default factory setting. The error will be maintained in the equipment's fault history.

#### **CIRCULATOR BLOWER**

This air handler is equipped with a variable speed circulator blower. This blower provides several automatically-adjusted blower speeds. The Specification Sheet applicable to your model provides an airflow table, showing the relationship between airflow (CFM) and external static pressure (E.S.P.).

#### TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

**NOTE:** Upon start up in communicating mode the circuit board may display an "Ed" error. This is an indication that the dip switches on the control board need to be configured in accordance with the Electric Heating Airflow Table. Configuring the dip switches and resetting power to the unit will clear the error code.

#### TROUBLESHOOTING

#### **ELECTROSTATIC DISCHARGE (ESD) PRECAUTIONS**

**NOTE:** Discharge body's static electricity before touching unit. Electrostatics can adversely affect electrical components.

Use the following precautions during air handler installation and servicing to protect the integrated control module from damage. By putting the air handler, the control, and the person at the same electrostatic potential, these steps will help avoid exposing the integrated control module to electrostatic discharge. This procedure is applicable to both installed and uninstalled (ungrounded) blowers.

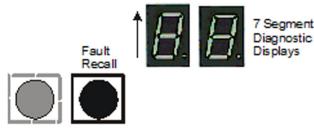

- 1. Disconnect all power to the blower. Do not touch the integrated control module or any wire connected to the control prior to discharging your body's electrostatic charge to ground.
- 2. Firmly touch a clean, unpainted, metal surface of the air handler blower near the control. Any tools held in a person's hand during grounding will be discharged.
- 3. Service integrated control module or connecting wiring following the discharge process in step 2. Use caution not to recharge your body with static electricity; (i.e., do not move or shuffle your feet, do not touch ungrounded objects, etc.). If you come in contact with an ungrounded object, repeat step 2 before touching control or wires.
- 4. Discharge your body to ground before removing a new control from its container. Follow steps 1 through 3 if installing the control on a blower. Return any old or new controls to their containers before touching any ungrounded object.

#### DIAGNOSTIC CHART

Refer to the Troubleshooting Chart at the end of this manual for assistance in determining the source of unit operational problems. The 7 segment LED display will provide any active fault codes. An arrow printed next to the display indicates proper orientation (arrow points to top of display).

See following image.

#### FAULT RECALL

The integrated control module is equipped with a momentary push-button switch that can be used to display the last six faults on the 7 segment LED display. To display the faults, follow the steps below.

**NOTE:** The integrated control module must be in Standby Mode (no thermostat inputs).

1. Press FAULT RECALL button (for 2 to 5 seconds). The 7 segment LED display will blink "--".

**NOTE:** If FAULT RECALL button is not pressed long enough (for 2 to 5 seconds, the control goes back to Standby Mode. If the button is pressed for 5 to 10 seconds, control goes back to Standby Mode.

- 2. Release the FAULT RECALL button. The 7 segment LED display will show the most recent fault.
- Subsequent pressing of the FAULT RECALL button will recall a previous fault. At the end of the faults, the 7 segment LED display will show "--" and go back to Standby Mode.

**NOTE:** Consecutively repeated faults are displayed a maximum of three times. If the FAULT RECALL button is left untouched longer than 3 minutes, the control goes back to Standby Mode.

To clear the error code history:

- 1. Press FAULT RECALL button until the 7 segment LED display blinks "--".
- 2. Release the FAULT RECALL button. The 7 segment LED display will show "88" and clear the faults.

**NOTE:** If FAULT RECALL button is help pressed for longer than 15 seconds, control goes back to Standby Mode.

### **DIAGNOSTIC CODES**

# SERVICING

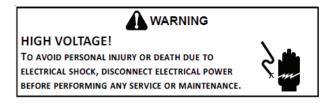

TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

#### DIAGNOSTIC CODES

7 SEGMENT LED DISPLAY	DESCRIPTION OF CONDITION
On	Normal Operation
Eb	NO HTR KIT INSTALLED - SYSTEM CALLING FOR AUXILIARY HEAT (Minor Error Code)
Ed	HEATER KIT DIP SWITCHES NOT SET PROPERLY
E5	FUSE OPEN
EF	AUXILIARY SWITCH OPEN
d0	DATA NOT ON NETWORK
d1	INVALID DATA ON NETWORK
d4	INVALID Bluetooth™ SHARED DATA LOADER DATA
b0	BLOWER MOTOR NOT RUNNING
b1	BLOWER MOTOR COMMUNICATION ERROR
b2	BLOWER MOTOR HP (Horse power) MISMATCH
b3	BLOWER MOTOR OPERATING IN POWER, TEMP., OR SPEED LIMIT
b4	BLOWER MOTOR CURRENT TRIP OR LOST ROTOR
b6	OVER/UNDER VOLTAGE TRIP OR OVER TEMPERATURE TRIP
b7	INCOMPLETE PARAMETER SENT TO MOTOR
b9	LOW INDOOR AIRFLOW (Minor Error Code) (without EH mode)
9b	LOW INDOOR AIRFLOW (Major Error Code) (EH mode only)
70	EEV DISCONNECTION DETECTED
73	LIQUID SIDE THERMISTOR ABNORMALITY
74	GAS SIDE THERMISTOR ABNORMALITY
75	PRESSURE SENSOR ABNORMALITY
77	INDOOR UNIT - THERMOSTAT COMMUNICATION ERROR (STARTUP OPERATION & DURING OPERATION)
Hu	HUMIDIFICATION DEMAND (Running without heating)
FC	FAN COOL - COMMUNICATING MODE ONLY (Fan Demand-Cool)
FH	FAN HEAT - COMMUNICATING MODE ONLY (Fan Demand-Heat)
F	FAN ONLY (Fan Demand-Manual)
H1	ELECTRIC HEAT LOW (Heat Demand, Back-up Heat Demand)
H2	ELECTRIC HEAT HIGH (Heat Demand, Back-up Heat Demand)
dF	DEFROST - COMMUNICATING MODE ONLY (note: defrost is displayed as H1 in a legacy setup)

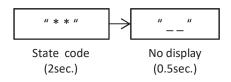

TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

### 2-digit 7 segment displays

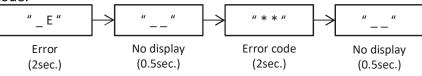

When the indoor unitis energized power supply, 2digit 7 segment displays on indoor control board show current status of state, error code and airflow.

1.State shows current operation status of indoor unit described in righttable.

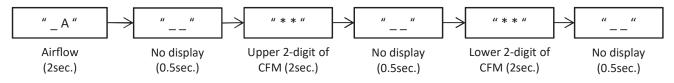

7 Segment LED Display (State)	Description of Condition
(No Display)	INTERNAL CONTROL FAULT/NO POWER
On	STANDBY, WAITING FOR INPUTS
	FAN COOL-COMMUNICATING MODE ONLY
FC	(Aux Heat Demand)
	FAN HEAT-COMMUNICATING MODE ONLY
FH	(Aux Heat Demand)
_F	FAN ONLY (Fan Demand-Manual)
	ELECTRIC HEAT LOW (Heat Demand, Back-up
H1	Heat Demand)
	ELECTRIC HEAT HIGH (Heat Demand, Back-up
H2	Heat Demand)
dF	DEFROST COMMUNICATING MODE ONLY
	HUMIDITY RUNNING WITHOUT HEATING
Hu	(Humidificat on Demand)

2. Error code shows current error indoor units have. To see the previous error code, please follow the instruction of fault recall. For more information of error code, please see the table of indoor unit error code.

3. Airflow shows estimated CFM of indoor unit. For example, if the CFM is 1240CFM, 7 segment display shows "A...12...40...".

The contents indicated at 7 segment display vary from operation mode and status of indoor unit. In the event of showing some error code, please follow the instruction in the table of indoor unit error code to solve the error.

1. When the unit is running in normal mode, 2-digit 7 segment displays show state and airflow status.

2. When the unit is having some major error code in normal mode, 2-digit 7 segment displays keep showing error code.

TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

### 2-digit 7 segment displays

3. When the unit is having some minor error code in normal mode, 2-digit 7 segment displays show error code and airflow status.

4. When the unit is having some minor error code during defrost operation in normal mode, 2-digit 7 segment displays show state "dF", error code and airflow status.

5. When the unit is having some minor error code in emergencymode, 2-digit 7 segment displays show state (EE) and error code.

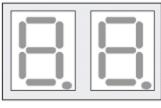

TROUBLESHOOTING-INDOOR UNIT FOR EEV APPLICABLE UNIT

#### MODE DISPLAY INTRODUCTION

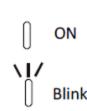

A 2-digit display is provided on the Control Board as a backup tool to the thermostat for accessing error codes and erasing error code history of the indoor unit. Follow the information provided in this section to learn how to use the mode display.

#### DISPLAY

The display consists of 2 digits.

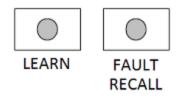

SEG1 SEG2

OFF

#### DISPLAY BUTTON LAYOUT

The display buttons shown can be used to navigate and select items:

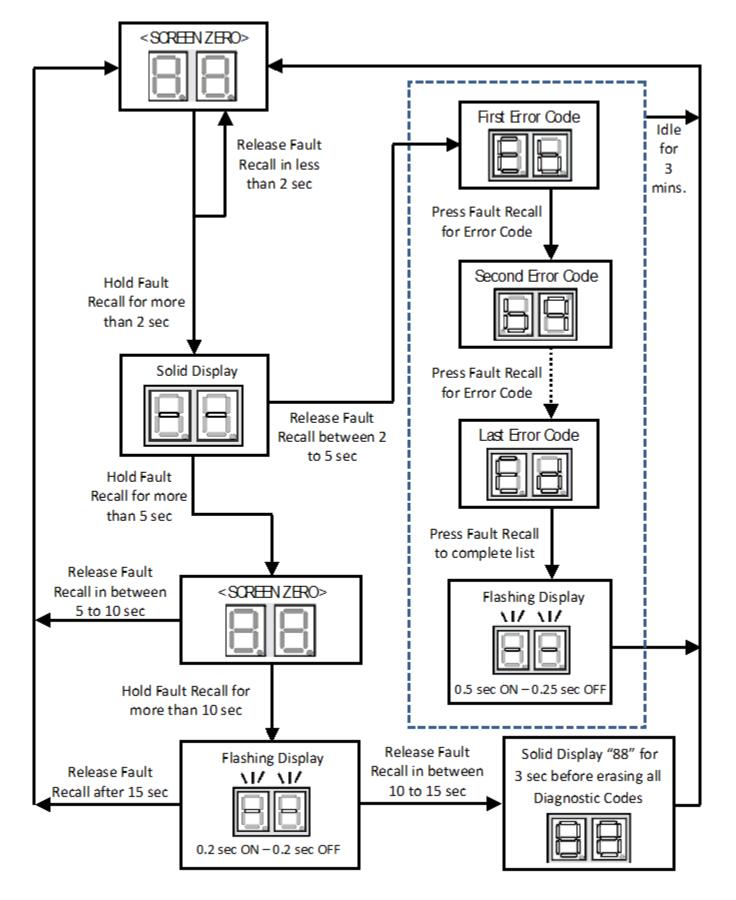

Example of button layout is shown above

#### FAULT CODE HISTORY NAVIGATION

This mode will allow the user to see the six most recent system faults. Please follow the flow chart to navigate to error codes from screen zero.

For a list of the fault codes, please see the TROUBLESHOOTING tables in this document.

It is also possible to erase all the diagnostics codes from this menu.

Error Code	Control Board LED Display	Transmitted Climate	Description	Possible Causes	Corrective Actions

#### AIR CONDITIONER ADVANCED FEATURE MENU

	HEAT PUMP / FAULT CODE HISTORY	
SUBMENU ITEM	INDICATION/USER MODIFIABLE OPTIONS	COMMENTS
ALL	(The Active and History Fault codes are displayed.)	Active fault code and up to 6 fault code histories.
ACTIVE	(The Active Fault codes are displayed.)	Active fault code only.
HISTORY	(The History Fault codes are displayed .)	Up to 6 fault code histories.
REFRESH	N/A	Selecting this menu will refresh the display.

	HEAT PUMP / CONFIGRATION INFO	
SUBMENU ITEM	INDICATION/USER MODIFIABLE OPTIONS	COMMENTS
HVAC DEVICE	HEAT PUMP	The type of HVAC Device.
FIRMWARE VERSION	**	Specific number associated with the control software.
MODEL NUMBER	*VZC200*01*	This number match the model name found on the serial plate.
SERIAL NUMBER	******	This number match the serial number found on the serial plate.

	HEAT PUMP / DEVICE STATUS	
SUBMENU ITEM	INDICATION(Units)	COMMENTS
HEAT CAPACITY REQUEST	%	The request for heating. 0% means the system is off. All other values mean the system is running.
COOL CAPACITY REQUEST	%	The request for cooling. 0% means the system is off. All other values mean the system is running.
HEAT CAPACITY REQUEST DURING DEFROST	%	Indoor heat request during defrost operation. It states that additional capacity is being requested or if it is not being requested. The outdoor unit will request supplemental heating while a defrost cycle is running. 0% means defrost is not being requested and additional heating is not requested and additional heating is not required. All other values mean defrost is being requested and additional heat is being requested.
DEHUMIDIFICATION REQUEST	%	Request for dehumidification. 0% means dehumidification is not being requested. All other values mean dehumidification is being requested.
OUTDOOR FAN SPEED	RPM	Current speed of the outdoor fan in rotations per minute.
REQUESTED AIRFLOW	CFM	This is the airflow the indoor unit will try to deliver while the unit is active.
REPORTED AIRFLOW	CFM	Indoor airflow (in cubic feet per minute) as reported by the indoor unit.
BOOST MODE	OFF or ON	If this feature is available and enabled, an inverter can ramp the compressor above default speeds to increase capacity. This shows if the feature is active or inactive. To check if this function is enabled, find the Boost Mode Enable item in the setting for this unit.

	HEAT PUMP / SENSOR DATA	
SUBMENU ITEM	INDICATION(Units)	COMMENTS
OUTDOOR TEMP	F	Displays the outdoor air temperature.
COIL TEMP	F	Displays the outdoor coil temperature.
LIQUID LINE TEMP	F	Displays the outdoor liquid temperature.
DISCHARGE TEMP	F	Displays the outdoor discharge temperature.
DEFROST SENSOR	F	Displays the defrost temperature.
SUCTION PRESSURE	PSI	Displays the pressure of taken slightly upstream of
SUCTION PRESSURE	FSI	the suction accumulator.

A representative menu is posted. Item ames and setting value are subject to change.

AIR CONDITIONER ADVANCED FEATURE MENU

	HEAT PUMP / DEVICE SETTING (1)						
SUBMENU ITEM	INDICATION(Units)	COMMENTS					
BOOST MODE ENABLE	OFF or ON	BOOST MODE is ON by default. See BOOST MODE section of this manual for more details.					
BOOST TEMP	Always Active or 70F to 105F in icrements	If enabled, when the ambient outdoor temperature is greater than this selected value, boost mode will be operational. Below this tenperature the mode will not function. There is also an option to keep boost mode countinuously enabled.					
INDOOR/OUTDOOR HEIGHT DIFFERENCE	Both Units at Same Level, Outdoor Unit is Lower, or Indoor Unit is Lower	If the outdoor & indoor units are within +/- 15 ft. vertical distance, select SAME LEVEL. If the outdoor unit is more than 15 ft. below the indoor unit, select OUTDOOR LOWER. If the outdoor unit is more than 15 ft. above the indoor unit, select INDOOR LOWER.					
RESET FOR SYSTEM SET UP	NO or YES	Selecting yes will reset any system setting to their factory defaults.					
SYSTEM VERIFICATION TEST	OFF or ON	System Verification Test must be run after installation. This is approximately a 5-15 minute test. If operation mode is set to COOL mode, the system will enter CHARGE mode upon completion, otherwise it will stop.					
PUMP DOWN	OFF or ON	Enter PUMP DOWN Mode. This procedure runs the equipment for approximately 15 minutes and allows accumulation of refrigerant at the outdoor unit for purposes of removing & replacing the indoor unit or outdoor unit.					
ACTIVATE CHARGE MODE	OFF or ON	Enter Charging Mode. This allows for a steady system operation for a duration of approximately 1 hour to allow for refrigerant charging of the system via the charge port.					
COOLING TRIM FACTOR(HIGH) *1, 2	-15% to +15% in 5% increments	Select this airflow trim when inverter system is running high compressor speeds during a cooling cycle.					
COOLING TRIM FACTOR(MID)	-15% to +15% in 5% increments,20 30, Full(Max) $^{3}$	Select this airflow trim when inverter system is running mid-range (intermediate) compressor speeds during a cooling cycle.					
COOLING TRIM FACTOR(LOW)	-15% to +15% in 5% increments,20 30, Full(Max) $^{3}$	Select this airflow trim when inverter system is running low compressor speeds during a cooling cycle.					
COOLING AIRFLOW PROFILE	A, B, C, or D	If it is desirable to quickly ramp up the indoor airflow select profile A. If it is desirable to reach nominal airflow quickly, but a slower ramp up time is required, select profile B. If dehumidification is required immediately when cooling mode begins select profile C. If a slower airflow ramp up / ramp down time is required in addition to dehumidification select profile D.					
BLOWER ON DELAY-COOLING	5, 10, 20 or 30 Seconds	Delay between compressor turning on and indoor blower turning on during a cooling cycle.					
BLOWER OFF DELAY-COOLING	30, 60, 90 or 120 Seconds	Delay between compressor shutting off and the indoor blower shutting off after a cooling cycle.					

A representative menu is posted. Item names and setting value are subject to change.

\*1 At Cool and Heat Hi speed trim, \*SXV906010\*\* with \*\*VC960804C,

\*\*VM970804C and \*MVC800804C combination trim more than 5% settings are invalid. Trimmed up CFM makes miss matching error.

\*2 Other than the above, depending on the connected indoor unit, there are restrictions on the positive side Trim setting.

If you want to change the Cool Airflow Trim to positive side, be sure to confirm the Airflow Trim restrictions in the latest indoor unit installation manual. The latest manual can be obtained from the website "PartnerLink(InfoFinderPlus/Literature)".

[PartnerLink URL]

https://partnerlinkmarketing.goodmanmfg.com/goodman/info-finder-plus

\*3 The Inverter system uses lower compressor speed and lower indoor unit CFM to optimize system performance.

To obtain 100% CFM for home circulation, use full Trim setting instead of Int/Low speed.

This is recommended for applications with unusually cold return temperatures such as basements.

\*4 Please refer to the page of "DEHUMIDIFICATION SELECT" for details of this function.

AIR CONDITIONER ADVANCED FEATURE MENU

	AIR CONDITIONER / DEVICE SETTING (2)	
SUBMENU ITEM	INDICATION(Units)	COMMENTS
DEHUMIDIFICATION ENABLE <sup>*4</sup>	Standard, OFF, A, B or C	Selecting "OFF" disables dehumidification selecting. "Standard", "A", "B" or "C" enables dehumidification.
RESET COOLING SETTINGS	NO or YES	Selecting yes will reset any cooling setting to their factory defaults.
RPS RANGE FOR COOLING	**.* to **.* RPS,(Total 5 Ranges)	When determining the appropriate compressor speed for cooling, select the range that contains the desired value. The Selected RPS for Cooling menu is where you will select your desired value within this selected range.
SELECTED RPS FOR COOLING	**.* RPS	This value will be a number inside the RPS Range for Cooling. If you'd like to select a RPS from a different range, you must change the RPS Range for Cooling setting first, then restart the device setting page.

A representative menu is posted. Item names and setting value are subject to change.

\*1 At Cool and Heat Hi speed trim, \*SXV906010\*\* with \*\*VC960804C,

\*\*VM970804C and \*MVC800804C combination trim more than 5% settings are invalid. Trimmed up CFM makes miss matching error.

\*2 Other than the above, depending on the connected indoor unit, there are restrictions on the positive side Trim setting.

If you want to change the Cool Airflow Trim to positive side, be sure to confirm the Airflow Trim restrictions in the latest indoor unit installation manual. The latest manual can be obtained from the website "PartnerLink(InfoFinderPlus/Literature)".

[PartnerLink URL]

https://partnerlinkmarketing.goodmanmfg.com/goodman/info-finder-plus

\*3 The Inverter system uses lower compressor speed and lower indoor unit CFM to optimize system performance.

To obtain 100% CFM for home circulation, use full Trim setting instead of Int/Low speed.

This is recommended for applications with unusually cold return temperatures such as basements.

\*4 Please refer to the page of "DEHUMIDIFICATION SELECT" for details of this function.

#### EMERGENCY MODE FOR EEV APPLICABLE INDOOR UNIT

WARNING **HIGH VOLTAGE** DISCONNECT ALL POWER BEFORE SERVICING. MULTIPLE POWER SOURCES MAY BE PRESENT. FAILURE TO DO SO MAY CAUSE PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

Emergency mode is to only be used in a situation where communication between equipment (broken wires) or a failed thermostat cannot be immediately corrected or replaced. This mode will allow for cooling or heating to be activated without the need of communication wires or a thermostat. Once corrections have been made to wiring or the thermostat, emergency mode must be turned off and the system returned to normal operation (this applies to both the indoor and outdoor units). NOTE: Emergency mode does not control to a specific room temperature set point. Exact room temperature achieved is related to the building load at the time emergency mode is activated. This is only a temporary solution.

At first inspection, if the outdoor unit is displaying one of the following error codes: E51 (outdoor communication error), Eb0 (no indoor airflow), Eb9 (low indoor airflow), Ed2 (Indoor unit is too small and cannot provide airflow of outdoor unit) or the indoor unit is displaying error code E77 (no thermostat communications) it is acceptable to use emergency mode if the equipment cannot be immediately fixed. Cycling power to the equipment may temporarily clear error codes, but doing so may not fix the underlying problem. NOTE: If after initial power up communication issues occur due to faulty wires or a thermostat these error codes may not be displayed.

In emergency mode, the unit will function according to the mode selected on the appropriate dip switches. Operation in emergency mode must be limited to a minimum and should be viewed as a temporary solution before the issue with the unit is resolved and system operates in normal mode.

**NOTE:** In the emergency operation, the operating status will not be shown in the thermostat status menu or on the outdoor 7-segment displays. The 7-segment displays on indoor control board will display "EE".

#### 1. HEATING EMERGENCY MODE

Emergency Heating mode is to be used when communication between the indoor unit and thermostat is not functioning properly. This mode will run the electric heat strips independently of any thermostat in one of two modes: High Heat Level or Low Heat Level. Dip Switch Bank DS-6 (specifically dip switches S-21 and S-22) on the indoor control is used to engage emergency heating mode. Default setting for these two dip switches are in the OFF position (S21 set to ON and S22 set to ON will enable Low Heat Level Emergency Mode, S21 set to OFF and S22 set to ON will enable High Heat Level Emergency Mode). NOTE: once equipment has been fixed, these dip switches must be placed back in the OFF position. During operation, the indoor fan and electric heater kit will be turned on and off at following intervals based on the Heat Level selected. 2 stage electric heater kits will be energized in stage 2.

	Heating On	Heating Off
High Heat Level	8 minutes	8 minutes
Low Heat Level	7 minutes	15 minutes

Emergency Heat Mode Airflow: DIP switches S-9, S-10, S-11 and S-12 must be set to the correct size electric heat kit that has been installed. These are located on dip switch bank DS-3 of the indoor control. See the Switch Bank DS-3 Indoor Control Board Settings table to properly select heater kit size.

To activate heating emergency mode, appropriately select switches S-21 and S-22 from dip switch bank DS-6 on the indoor control board depending on the heat level required in accordance with the Switch Bank DS-6 Indoor Control Board Settings table.

**NOTE:** During the heating emergency mode, outdoor unit must stop operation. Once the communication is established, heating emergency mode must be terminated so that the system resumes operation in normal mode. To eliminate the heating emergency mode, dip switches S-21 and S-22 from dip switch bank DS-6 on the indoor control board must be set back to default factory settings (normal operating mode).

Upon start up in emergency mode the circuit board may display an "Ed" error. This is an indication that the DIP switches on the control board need to be configured in accordance with the Electric Heating Airflow Table. Configuring the DIP switches to the unit will clear the error code.

#### 2. COOLING EMERGENCY MODE

Cooling emergency mode is to be used when communication between the indoor and outdoor units is not functioning properly and temporary cooling operation is required. This mode enables the outdoor unit and indoor unit to run independently of each other. There are two key steps to setup Cooling Emergency Mode.

- a) Select the appropriate airflow on the indoor unit and enable emergency indoor airflow operation (using Dip switches S-13 and S-14 of Switch Bank DS-4 on the indoor unit to select desired 25%, 50%, 75% or 100% airflow. In addition, set switch bank DS-6 dip switches S-21 to ON and S-22 to OFF enabling emergency indoor fan).
- b) Select the desired cooling level at the outdoor unit (there are 3 levels available: Low Cool Level, Medium Cool Level, High Cool Level selectable by dip switch bank DS-2 on the outdoor unit). See Dip Switch Position DS2-1 and DS2-2 Table for cooling level selection.

Switch Bank DS-4 Indoor Fan Settings										
Function	Value	SW13	SW15	SW16						
Fan Only Speed %	25	OFF	OFF	-	-					
	50	ON*	OFF*	-	-					
	75	OFF	ON	ON*	-					
	100	ON	ON	OFF	-					

During operation the indoor unit will provide constant airflow as selected (even if the compressor has stopped). The indoor unit will continue to operate the electronic expansion valve for refrigerant super heat control and the compressor will cycle at the interval selected by dip switch bank DS-2.

Dip Swi	tch Position	Function
DS2-1	DS2-2	Function
ON	ON	Normal Operation
ON	OFF	Emergency Mode (Low Cool Level)
OFF	ON	Emergency Mode (Medium Cool Level)
OFF	OFF	Emergency Mode (High Cool Level)

	ON time	OFF time	Avg. Run Time
Low Cool Level	7 minutes	15 minutes	30%
Medium Cool Level	8 minutes	10 minutes	50%
High Cool Level	15 minutes	6 minutes	70%

**NOTE:** This mode does not require a thermostat. Any thermostat requests will be ignored while in emergency operation.

**NOTE:** Set indoor DS-4 (Indoor fan setting) and DS-6 (Indoor emergency mode enable) before setting outdoor DS-2 dip switch settings. Otherwise, the compressor may be damaged in operation.

**NOTE:** When proper communication is established, these switches must be returned to default settings

The compressor speed will automatically adjust based on the outdoor ambient temperature. If ambient temperature is higher than  $95^{\circ}$ F, the outdoor unit can operate at 100% compressor speed. If ambient temperature is lower than  $70^{\circ}$ F, the unit will run at 50% compressor speed. Between  $95^{\circ}$ F and  $70^{\circ}$ F, the compressor speed will adjust linearly as shown.

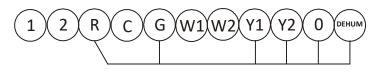

TROUBLESHOOTING- OUTDOOR UNIT AND INDOOR UNIT FOR EEV APPLICABLE UNIT

\* Must be set at factory setting to operate the normal mode. \*\* Must be set at factory setting indoor unit with EEV. It's prohibited to change setting.

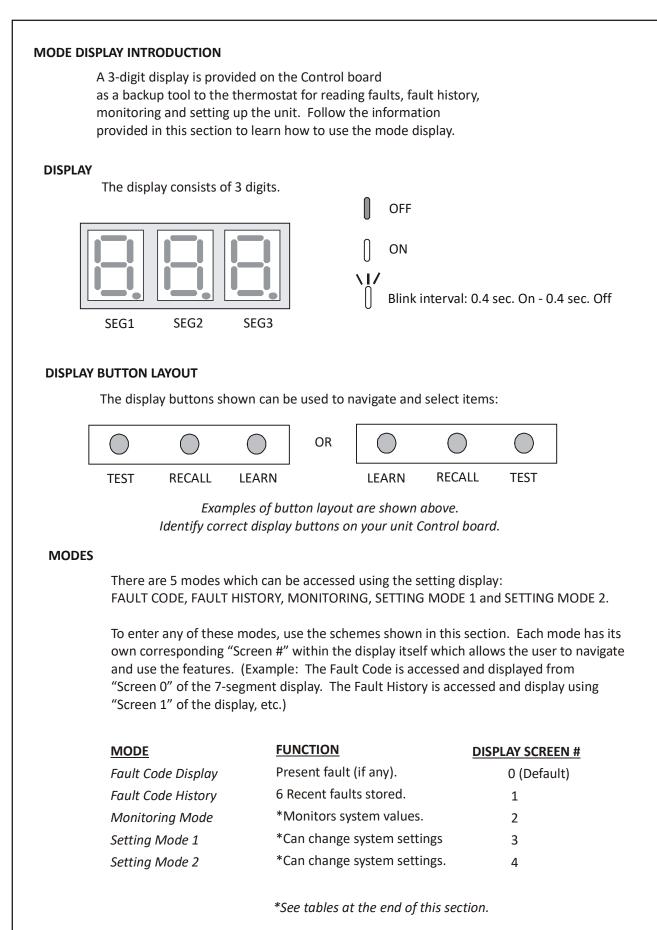

#### COOLING EMERGENCY MODE WIRING FOR TXV AP-PLICABLE INDOOR UNIT

Cooling emergency mode is available when using a TXV applicable indoor unit. To energize the blower at the appropriate speed, standard Legacy wiring is required. The image below shows how the thermostat input terminals are to be wired when selecting a cooling airflow. NOTE: the blower will run continuously with this wiring which is required. The outdoor unit will cycle as described in the Cooling Emergency Mode section when appropriate dip switch modes are set.

#### INDOOR UNIT INTEGRATED CONTROL MODULE

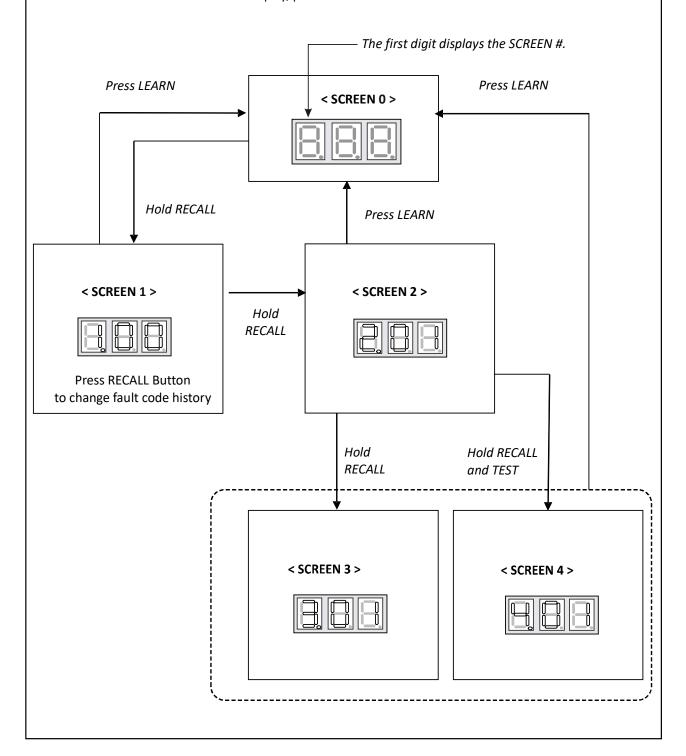

**NOTE:** Emergency heating mode is not available with TXV applicable indoor units. If communications still exist between the indoor unit and thermostat, the thermostat should be used to provide heating calls.

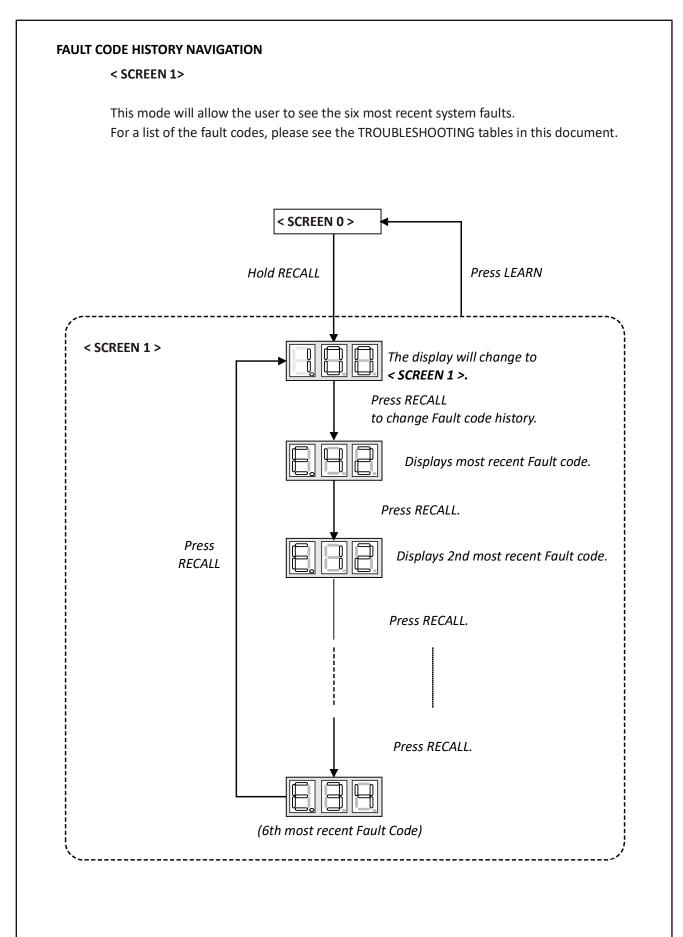

#### NAVIGATING THROUGH THE DISPLAY SCREENS

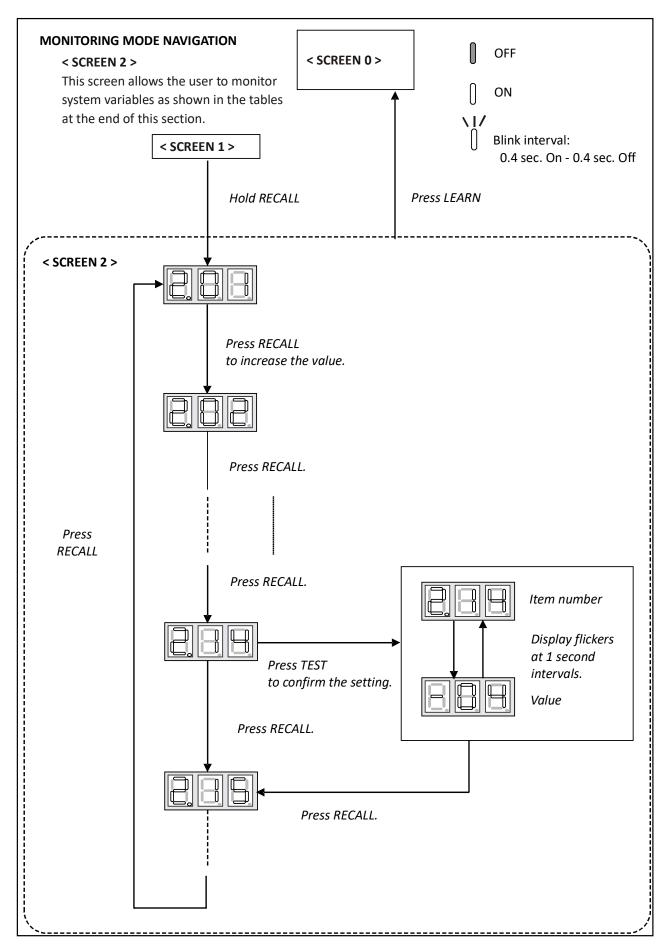

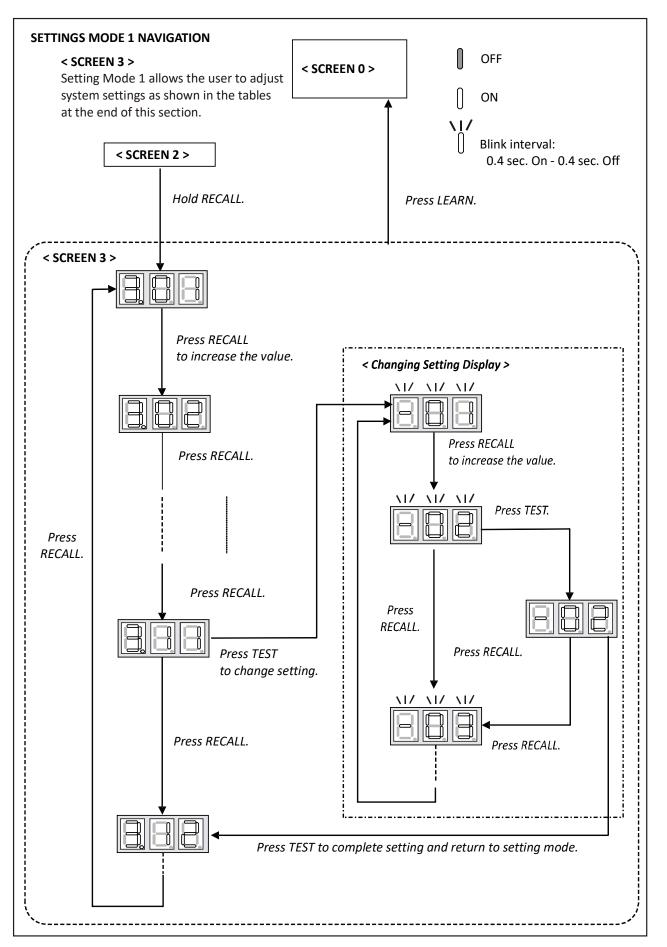

- **SCREEN 1** To access, hold the RECALL button for 5 seconds at screen 0.
- **SCREEN 2** To access, hold the RECALL button for 5 seconds at screen 1.
- **SCREEN 3** To access, hold the RECALL button for 5 seconds at screen 2.
- **SCREEN 4** To access, hold the RECALL and TEST buttons simultaneously for 5 seconds at screen 2. To return to SCREEN 0 of the display, press the LEARN button.

14	Zoning Selection	<u>0: ON</u> 1: OFF	
15	Circulation Selection	<u>0: ON</u> 1: OFF	

**NOTE:** Parameters as per factory setting are highlighted in bold and underlined.

- \*1 \*SXV906010\*\* with \*\*VC960804C, \*\*VM970804C and \*MVC800804C combination trim more than 5% settings are invalid. Trimmed up CFM makes mismatching error.
- \*2 Depending on the connected indoor unit, there are restrictions on the positive side Trim setting. If you want to change the Cool Airflow Trim to positive side, be sure to confirm the Airflow Trim restrictions in the latest manual. The latest manual can be obtained from the website "PartnerLink(InfoFinderPlus/Literature)". [PartnerLink URL]
- https://partnerlinkmarketing.goodmanmfg.com/goodman/info-finder-plus
- \*3 The Inverter system uses lower compressor speed and lower indoor unit CFM to optimize system performance. To obtain 100% CFM for home circulation, use full Trim setting instead of Int/Low speed. This is recommended for applications with unusually cold return temperatures such as basements.
- \*4 Please refer to the page of "Dehumidification Select" for details of this function.

28	E28	COIL TEMP FAIL2	The control has detected that the Outdoor Coil Temperature Sensor is out of range.	<ul> <li>Outdoor coil thermistor inoperable or not properly connected</li> </ul>	Check the connection to OD coil thermistor; Repair/replace if needed
29	E29	LIQ TEMP FAIL	The control has detected that the Liquid Temperature Sensor is out of range.	<ul> <li>Liquid thermistor inoperable or not properly connected</li> </ul>	Check the connection to liquid thermistor; Repair/replace if needed
30	E30	OD CTRL FAIL3	Indicates the control board may need to be replaced.	Wiring to control board disconnected     Faulty control board     Noise	<ul> <li>Check wiring to control board; Repair as needed</li> <li>Replace control board if necessary</li> </ul>
31	E31	HI LEAK CURRENT	The control has detected high leakage current (high voltege).	<ul><li>Improper ground</li><li>Faulty compressor</li></ul>	•Check ground screws/lugs and wiring; Repair/replace if needed • Check the compressor; Repair/replace if needed
32* <sup>2</sup>	E32	HI TEMP CTRL1	This error indicates the equipment is experiencing high temperature faults on the outdoor control board.	<ul> <li>Ambient air conditions too high</li> <li>Cooling bracket screw(s) missing or not properly fastened (2-4 ton only)</li> <li>No or poor thermal grease coating between cooling plumbing and cooling bracket on control board (2-4 ton only)</li> <li>Outdoor fan low speed (5 ton only)</li> <li>No flow or limited flow through control board cooling circuit (potential restriction in line or low refrigerant) (2-4 ton only)</li> <li>Stop valve not completely open (2-4 ton only)</li> </ul>	Cycle power; re-try during usable ambient temperature range     Verify cooling bracket screws in place and secure; Secure fasteners as needed (2-4 ton only)     Check thermal grease inside cooling bracket on control board; Apply additional grease as needed     Check outdoor fan motor & wiring; Repair/replace if needed (5 ton only)     Check for restriction in line     Check refrigerant charge level; Adjust if needed (2-4 ton only)     Check the opening of stop valve, should be full open; Repair/replace if needed (2-4 ton only)
33* <sup>2</sup>		HI TEMP CTRL2	This error indicates the equipment is experiencing high temperature faults on the outdoor control board. Control has determined continued operation is acceptable. This indicates they may be a problem with the equipment.	<ul> <li>Ambient air conditions too high</li> <li>Cooling bracket screw(s) missing or not properly fastened (2-4 ton only)</li> <li>No or poor thermal grease coating between cooling plumbing and cooling bracket on control board (2-4 ton only)</li> <li>Outdoor fan low speed (5 ton only)</li> <li>No flow or limited flow through control board cooling circuit (potential restriction in line or low refrigerant) (2-4 ton only)</li> <li>Stop valve not completely open (2-4 ton only)</li> </ul>	<ul> <li>Cycle power; re-try during usable ambient temperature range</li> <li>Verify cooling bracket screws are in place and secure; Secure fasteners as needed (2-4 ton only)</li> <li>Check thermal grease inside cooling bracket on control board; Apply additional grease as needed</li> <li>Check outdoor fan motor &amp; wiring; Repair/replace if needed (5 ton only)</li> <li>Check for restriction in line</li> <li>Check refrigerant charge level; Adjust if needed (2-4 ton only)</li> <li>Check the opening of stop valve - it should be fully</li> <li>open; Repair/replace if needed (2-4 ton only)</li> </ul>
34	E34	CURRENT SPIKE	Board detected a high current condition. This indicates the potential for a short circuit.	Current spike in supply     Stop valve not completely open     The compressor wire is lost phase     Faulty control board     Faulty compressor	Check power supply for in-rush current during start-up or steady state operation     Check the opening of stop valve, should be full open; Repair/replace if needed     Check the wire between control board and compressor     Replace control board if necessary     Check the compressor; Repair/replace if needed

### OUTDOOR UNIT ERROR CODES

Fault Code	Control Board LED Display	Transmitted Climate Talk Message	Thermostat Fault	Probable Causes	Corrective Actions
35	E35	HIGH CURRENT	Board detected a high current condition.	Short circuit condition     Stop valve not completely open     Overcharge     Faulty control board     Faulty compressor	Check installation clearances.     Check the opening of stop valve, should be full open; Repair/replace if needed     Check refrigerant charge level; Adjust if needed     Replace control board if necessary     Check the compressor; Repair/replace if needed.
36	E36	STARTUP ERROR	The control encountered an abnormal condition during the startup procedure.	Blocked/restricted condenser coil and/or lines     The compressor wire is lost phase     Inconsistent compressor load     Faulty control board	Check and clean condenser coil and/or lines     Check the wire between control board and compressor     Replace control board if necessary
37	E37	OD CTRL FAIL4	Indicates the control board may need to be replaced.	Outdoor fan motor not connected properly     Faulty control board	<ul> <li>Check wiring from outdoor fan motor to control board; Repair if needed</li> <li>Replace control board if necessary</li> </ul>
38	E38	COMP VOLTAGE	The control has detected a voltage related issue with the compressor.	High or low voltage from supply     The compressor wire is lost phase     Faulty control board	Correct low/high line voltage condition; Contact local utility if needed     Check the wire between control board and compressor     Replace control board if necessary
39	E39	OD CTRL FAIL5	Indicates the control board may need to be replaced.	Thermistors inoperable or improperly connected     Faulty control board	<ul> <li>Check the connection to thermistors;</li> <li>Repair/replace if needed</li> <li>Replace control board if necessary</li> </ul>
40	E40	COMP MISMATCH	Control determines that its compressor requirement is different than the compressor capability.	Bluetooth® Shared Data Loader BTSDL01 not correct     Control board mismatch	Check Bluetooth® Shared Data Loader BTSDL01 data vs. air conditioner model Verify control board size vs. air conditioner model; Replace control board if necessary
41	E41	LOW REFRIGERANT	The control has detected a low refrigerant condition.	Refrigerant leak     Low refrigerant charge     Thermisters inoperable or not properly connected	Test for system leaks using leak test procedure     Check refrigerant charge leve; Adjust if needed     Checkthe connection to thermistor; Repair/replace if needed
42	E42	LOW LINE VOLT	Control detects a low power supply voltage condition.	Low line voltage supply	Check circuit breakers and fuses; Replace if needed     Verify unit is connected to power supply as specified on rating plate     Correct low line voltage condition; Contact local utility if needed
43	E43	HIGH LINE VOLT	Control detects a high power supply voltage condition.	High line voltage supply	Verify unit is connected to power supply as specified on rating plate     Orrect high line voltage condition; Contact local utility     if needed
44	E44	OP TEMP RANGE	The control detects the outdoor temperature outside recommended operational range. Unit may continue to operate normally.	Ambient air conditions too high or low	Cycle power; re-try during usable ambient temperature range
45	E45	NO COOLING TEST	The control is unable to start the Cooling mode test because indoor heat has been turned on by thermostat. Please set thermostat to off position.	Heat provided by secondary heating source	Turn off heater using thermostat before running AHRI mode
46	E46	NO HEATING TEST	The control is unable to sart the Heating mode test becaue indoor heat has been turned on by thermostat. Please set thermostat to off position.	Heat provided by secondary heating source	Turn off heater using thermostat before running AHRI mode
47	E47	NO SYS VER TEST	The control is unable to start the System Verification test because indoor heat has been turned on by thermostat. Please set thermostat to off position.	Heat provided by secondary heating source	Turn off heater using thermostat before operation
48	E48	NO PUMP DOWN	The control is unable to enter the Pump Down Mode because indoor heat has been turned on by thermostat. Please set thermostat to off position.	Heat provided by secondary heating source	Turn off heater using thermostat before operation
49	E49	NO CHARGE MODE	The control is unable to enter Charging Mode because indoor heat has been turned on by thermostat. Please set thermostat to off position.	Heat provided by secondary heating source	Turn off heater using thermostat before operation
50	E50	LINE VOLT CTRL	This indicates there is a voltage issue on the control board. See service manual for troubleshooting information.	High or low voltage from supply     Faulty control board	Correct low/high line voltage condition; Contact local utility if needed     Replace control board if necessary
51* <sup>2</sup>	E51	OD COMM ERROR	This indicates potential communication issues have been detected by the outdoor control board.	Communication wiring disconnected	<ul> <li>Check communication wiring; Repair as needed</li> </ul>
52	-	COMP FAIL MINOR	This error indicates the equipment is experiencing frequent compressor faults. Control has determined continued operation is acceptable. This indicates they may be a problem with the equipment.	Stop valve not completely open     The compressor wire is lost phase     Compressor motor failure	Check the opening of stop valve, should be full open; Repair/replace if needed Check the wire between control board and compressor Inspect compressor motor for proper function; Replace if necessary

67

### OUTDOOR UNIT ERROR CODES

Fault Code	Control Board LED Display	Transmitted Climate Talk Message	Thermostat Fault	Probable Causes	Corrective Actions
53	-	PCB PR FAN MIN	This error indicates the equipment is experiencing frequent outdoor control board and/or motor faults. Control has determined continued operation is acceptable. This indicates there may be a problem with the equipment.	Obstruction in fan rotation     Ooutdoor fan motor not connected properly     Outdoot fan not running     Faulty control board     Noise	<ul> <li>Check and clean grille of any debris</li> <li>Check wiring from outdoor fan motor to control board; Repair if needed</li> <li>Check outdoor fan motor &amp; wiring; Repair/replace if needed</li> <li>Replace control board if necessary</li> </ul>
54	-	EEV MINOR	This error indicates the equipment is experiencing frequent low discharge superheat faults. Control has determined continued operation is acceptable. This indicates they may be a problem with the equipment.	Thermistors inoperable or improperly connected     Faulty TXV     Faulty control board	<ul> <li>Check the connection to thermistors;</li> <li>Repair/replace if needed</li> <li>Check TXV; Replace if needed</li> <li>Replace control board if necessary</li> </ul>
55	-	HI DIS TEMP MIN	This error indicates the equipment is experiencing frequent high discharge temperature faults. Control has determined continued operation is acceptable. This indicates they may be a problem with the equipment.	<ul> <li>Discharge thermistor inoperable or improperly connected</li> <li>Discharge thermistor is put on incorrect position or off</li> <li>Low refrigerant charge</li> <li>Overcharge</li> <li>Faulty compressor</li> </ul>	Check discharge thermistor resistance and connections; Repair/replace as needed     Check discharge thermistor position     Check refrigerant charge level; Adjust if needed     Check refrigerant charge level; Adjust if needed     Check the compressor; Repair/replace if needed
57	-	CL LOOP SWEAT	This indicates the control is sensing sweating on the cooling loop.	Refrigerant Leak     Low refrigerant charge     Faulty TXV     Thermistors inoperable or improperly connection	Test for system leaks using leak test procedure     Check refrigerant charge level; Adjust if needed     Check TXV; Replace if needed     Check the connection to thermistors; Repair/replace if needed
В0	Eb0	NO ID AIRFLOW	The estimated airflow from indoor subsystem is near to 0 CFM.	<ul> <li>Failed indoor blower motor</li> <li>Indoor fan motor not properly connected</li> <li>Too much static pressure</li> </ul>	<ul> <li>Check ID fan motor wiring and connectors;</li> <li>Repair/replace if needed</li> <li>Check ID fan motor; Replace if needed</li> </ul>
В9	Eb9	LOW ID AIRFLOW	Estimated airflow from motor is lower than the airflow requirement.	<ul> <li>Failed indoor blower motor</li> <li>Indoor fan motor not properly connected</li> <li>Too much static pressure</li> </ul>	<ul> <li>Check ID fan motor wiring and connectors;</li> <li>Repair/replace if needed</li> <li>Check ID fan motor; Replace if needed</li> </ul>
D0	Ed0	NO NET DATA	Control board does not have the necessary data for it to properly perform its functions.	<ul> <li>Air conditioner is wired as part of a communicating system and integrated control module does not contain any shared data.</li> </ul>	Replace control board if necessary     Re-write shared data using Bluetooth®     Shared Data Loader BTSDL01
D1	Ed1	INVALID DATA	Control board does not the appropriate data needed to properly perform its functions.	<ul> <li>Air conditioner is wired as part of a communicating system and integrated control module contains invalid shared data or network data is invalid for the integrated control module.</li> </ul>	Replace control board if necessary     Re-write shared data using Bluetooth® Shared Data Loader BTSDL01
D2	Ed2	INVALID SYSTEM	The airflow requirement is greater than the airflow capability of the indoor subsystem.	<ul> <li>Air conditioner/heat pump is wired as part of a communicating system and outdoor unit requires airflow greater than indoor unit's airflow capability</li> <li>Shared data is incompatible the system or missing parameters</li> <li>Communication wiring has loose connection.</li> </ul>	<ul> <li>Verify shared data is correct for your specific model; Repopulate data if required</li> <li>Check communication wiring. Repair as needed.</li> </ul>
D3	Ed3	INVALID CONFIG	There is a mismatch between the shared data and the control physical hardware.	Shared data sent to integrated control module does not match hardware configuration.	<ul> <li>Verify shared data is correct for your specific model; Repopulate data if required.</li> </ul>
D4	Ed4	INVALID MC DATA	The Bluetooth® Shared Data Loader BTSDL01 data has been rejected.	<ul> <li>Shared data on Bluetooth® Shared Data Loader BTSDL01 has been rejected.</li> </ul>	<ul> <li>Verify shared data is correct for your specific model; Repopulate data if required.</li> </ul>
		Ite	ms below are messages only disp This test is required at startup.	nayed on the thermostal screen.	
11	E11	RUN SYS TEST	Initialier should navigate top. Installer should navigate to the ComforrtNet User Menu, choose Air Conditioner, then EQUIP TEST and SYSYTEM TEST. Selecting ON will run the required test. Display will clear once testing is complete.	Incomplete SYSTEM TEST     SYSTEM TEST is running	MESSAGE ONLY

#### RE-WRITING SHARED DATA TO OUTDOOR UNIT USING BLUETOOTH® SHARED DATA LOADER BTSDL01

Check Troubleshooting codes to determine the need to flash shared data to outdoor unit. Follow the below procedure to flash shared data.

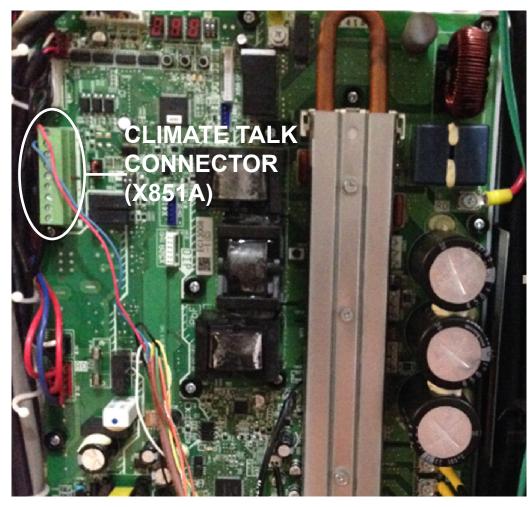

Procedure to flash shared data to Outdoor unit using Bluetooth® Shared Data Loader BTSDL01

- 1. Turn the power OFF to the outdoor unit.
- 2. Disconnect the Climate Talk (CT) connector from the outdoor unit.
- 3. Insert the Bluetooth® Shared Data Loader BTSDL01 on the outdoor unit.
- 4. Turn the power ON to the outdoor unit.
- Verify that H1P (red LED) flashes twice. This step confirms that the data has been transferred from the Bluetooth® Shared Data Loader BTSDL01 to the outdoor unit.
- 6. Turn the power OFF to the outdoor unit.
- 7. Remove the Bluetooth® Shared Data Loader BTSDL01 from the unit.

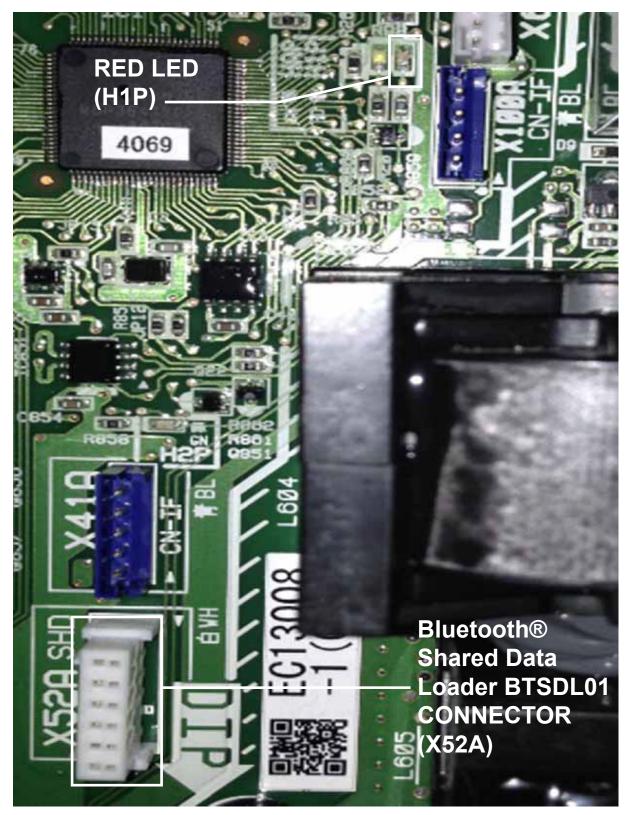

- 8. Connect the Climate Talk (CT) connector to the outdoor unit.
- 9. Turn the power ON to the outdoor unit.
- 10. Continue the operation of the unit as desired.

#### NOTE:

- If there is an error E11 on the 7-segment display of the Outdoor unit after step 11, run the System Verification Test on the Outdoor unit using the thermostat menu.
  - AC Menu → Air Conditioner → Equip Test → System Verification Test → ON
  - $\label{eq:hermitian} \begin{array}{ll} \bullet & HP \mbox{-} Menu \rightarrow Air \mbox{ Conditioner} \rightarrow Equip \mbox{ Test} \rightarrow System \mbox{ Verification Test} \rightarrow ON \end{array}$
- 2. The control boards for different 19.2 SEER2 OD units (2T, 3T, 4T, 5T) are different. Below are the names of the connectors for quick identification.
  - Bluetooth® Shared Data Loader BTSDL01 connector - X52A (white - 12 pin connector)
  - Climate Talk connector X851A (green 9 pin connector)
  - Red LED H1P

**IDENTIFICATION OF CONNECTORS ON 19.2 SEER2 OD CONTROL BOARD** 

ZOOMED VIEW OF 19.2 SEER2 OD CONTROL BOARD

### NETWORK TROUBLESHOOTING

If a network communication error code has occurred, use the following steps to help troubleshoot the system. (For network communication error codes, refer to the table below and the tables of error codes for outdoor unit and indoor unit.)

After any wiring changes have been made or DS1 dip switches on the outdoor unit control board have been changed, apply power to the system and see if the error codes have cleared.

1. Confirm low voltage wiring is correct per installation instructions. Check for miswiring. (i.e. Terminal 1 and 2 is reversed.)

**NOTE:** A removable plug connector is provided with the control to make thermostat wire connections. This plug may be removed, wire connections made to the plug, and replaced. It is strongly recommended that you do not connect more than two wires into a single terminal in the field because there is a risk of the wires becoming loose, which may result in intermittent operation.

2. Check wires for damage. (i.e. Broken wire at terminal, broken inside wire nuts or damaged cable between units.)

- 3. Perform continuity check on wires to make sure cable is OK. Replace the cable if necessary.
- 4. Change both dip switches of DS1 on the outdoor unit control board to the opposite position. See image above.

The integrated control module has some onboard tools that can be used to troubleshoot the network. These tools are: red communications LED, green receive (Rx) LED, and the learn button.

- Red communications LED Indicates the status of the network. The table below indicates the LED status and the corresponding potential problem.
- Green receive LED Indicates network traffic. The table below indicates the LED status and the corresponding potential problem.
- LEARN button Used to reset the network. Press the button for approximately 5 seconds to reset the network.

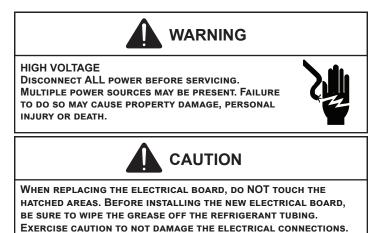

LED COLOR	LED Status	Indication	Probable Causes	Corrective Actions		
Red Communications	Off	Normal condition	• None	• None		
LED Outdoor unit control board: (H1P)	1 Flash	Communications failure	<ul> <li>Unknown packet is received</li> <li>Communications failure</li> </ul>	<ul><li>Depress learn button</li><li>Verify wiring connection</li></ul>		
Indoor unit control board :(H2P)	2 Flash	Out-of-box reset	<ul><li>Control power up</li><li>Learn button depressed</li></ul>	• None		
	Off	No power Communications error	<ul> <li>No power to unit</li> <li>Open fuse</li> <li>Communication error</li> </ul>	<ul> <li>Check circuit breakers and fuses; Reset/Replace if needed</li> <li>Reset network by depressing learn button</li> <li>Check communication wires (terminal 1/terminal 2 wires); Replace if needed</li> <li>Check for shorts in low voltage wiring.</li> </ul>		
Green Receive LED Outdoor unit control	1 Steady Flash	No network found	Broken/disconnected communication wire(s)     Unit is installed as a legacy/traditional system	<ul> <li>Check communication wires (terminal 1/terminal 2 wires); Replace if needed</li> <li>Check installation type (legacy/traditional c communicating)</li> </ul>		
board:(H2P) Indoor unit control	Rapid Flashing	Normal network traffic	• Control is "talking" on network as expected	• None		
board:(H3P)	On Solid	Terminal 1/Terminal 2 miss-wire	Terminal 1 and Terminal 2 wires reversed at indoor unit, thermostat, or outdoor unit     Short between terminal 1 and terminal 2 wires     Short between terminal 1 or terminal 2 two wires and terminal C (24VAC) or terminal R (24VAC, COM)	• Check communication wires (terminal 1/terminal 2 wires); Replace if needed

#### UNINSTALL THE ELECTRICAL BOARD

When uninstalling the main electrical board, remove the screws holding the cover in place. If board replacement is attempted without following proper uninstallation procedure, the refrigerant piping might be damaged. Always replace the grease with new grease on heat sink used for cooling. Not replacing grease may result in insufficient cooling and may damage the electrical board.

1. Remove the fixing screw A.

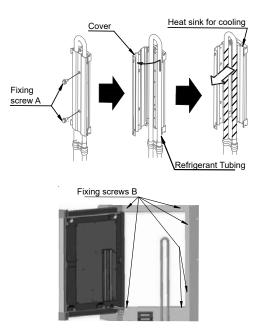

DISCONNECT AS NEEDED.

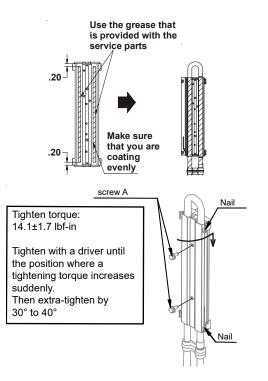

- 2. Lift the cover and open it in the direction shown in the figure.
- 3. Remove fixing screws B affixing the sheet metal plate.
- 4. Carefully slide the sheet metal plate with the electrical board behind the refrigerant tubing as shown.

#### INSTALL THE ELECTRICAL BOARD

When working on a service port, ensure that no refrigerant and/or compressor oil is sprayed onto the electrical board. This could damage the board's functionality.

- 1. Wipe the stale grease completely from the installed piping. If you reinstall the control board, make sure to wipe clean the heat sink on the board. Coat the surface with the standard quantity of the specified new grease.
- 2. Carefully slide the sheet metal plate back in and fix the screws B.
- 3. Do not apply force to the parts on the control board. Hold the control board plate NOT the control board.
- 4. Ensure that the liquid tube does not come in contact with any part of the PCB assembly.
- 5. Gently fit the tube in the heat sink troughs. Ensure good contact.
- 6. Close the cover, slide it downwards, fix it with the nails (two nails) and tighten fixing screws A so that the piping is tightly connected.

## 

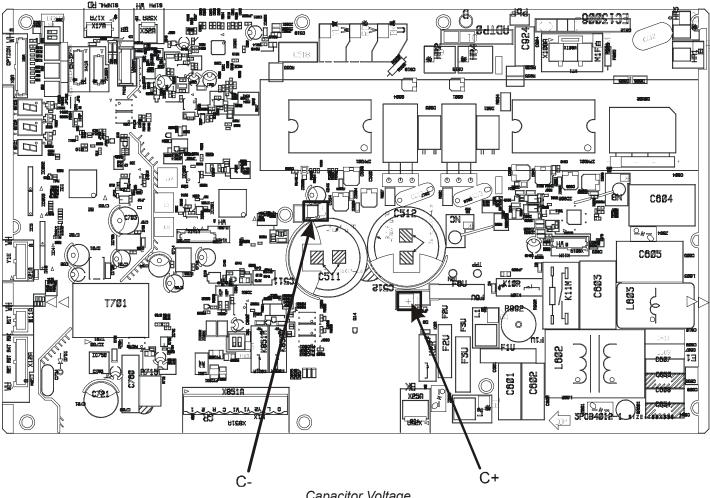

AVOID CONTACT WITH THE CHARGED AREA.

•NEVER TOUCH THE CHARGED AREA BEFORE CONFIRMING THAT THE RESIDUAL VOLTAGE IS 50 VOLTS OR LESS.

- 1. SHUT DOWN THE POWER AND LEAVE THE CONTROL BOX FOR 10 MINUTES.
- 2. MAKE SURE TO TOUCH THE EARTH GROUND TERMINAL TO RELEASE THE STATIC ELECTRICITY FROM YOUR BODY (TO PREVENT FAILURE OF THE PC BOARD).
- 3. MEASURE THE RESIDUAL VOLTAGE IN THE SPECIFIED MEASUREMENT POSITION USING A VOM WHILE PAYING ATTENTION NOT TO TOUCH THE CHARGED AREA.
- 4. IMMEDIATELY AFTER MEASURING THE RESIDUAL VOLTAGE, DISCONNECT THE CONNECTORS OF THE OUTDOOR UNIT'S FAN MOTOR. (IF THE FAN BLADE ROTATES BY STRONG WIND BLOWING AGAINST IT, THE CAPACITOR WILL BE CHARGED, CAUSING THE DANGER OF ELECTRICAL SHOCK.)

#### Inverter - Cooling

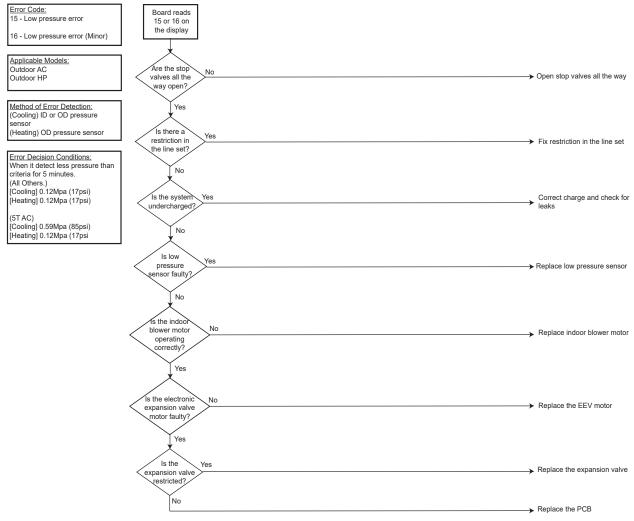

#### Inverter - Heating

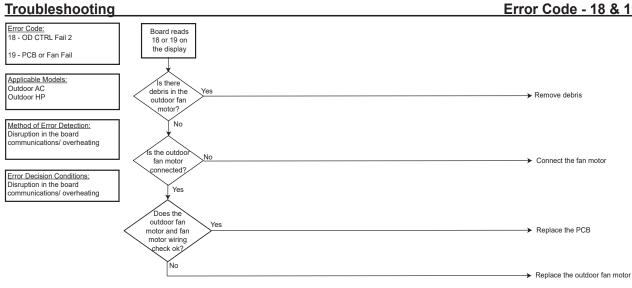

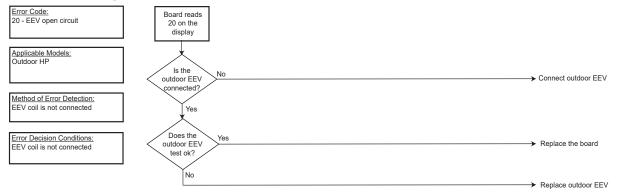

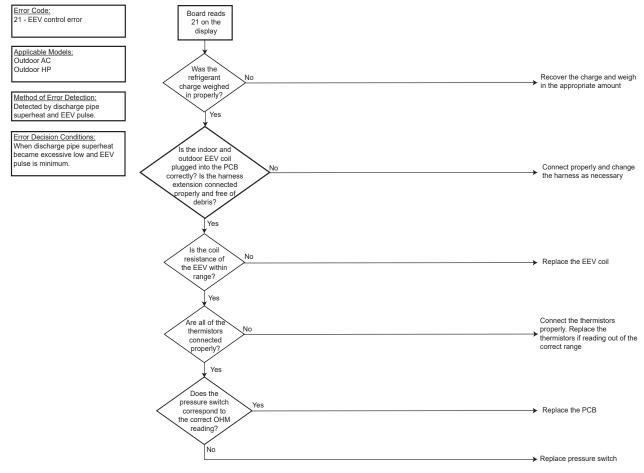

#### Error Code - 15 & 16

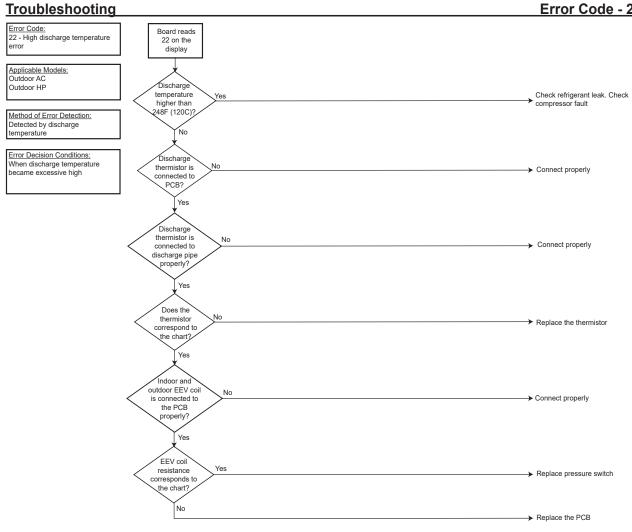

#### Error Code - 18 & 19

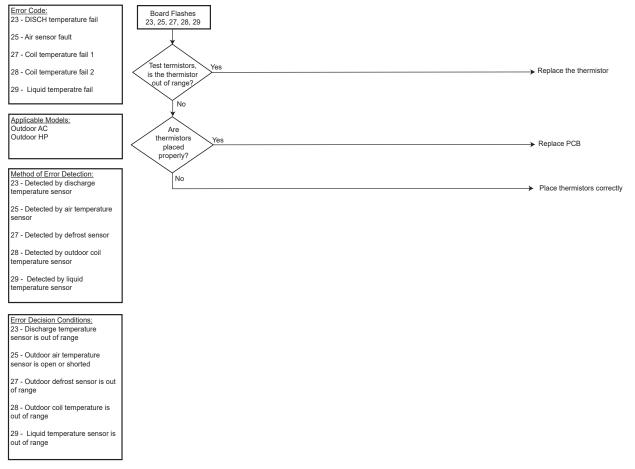

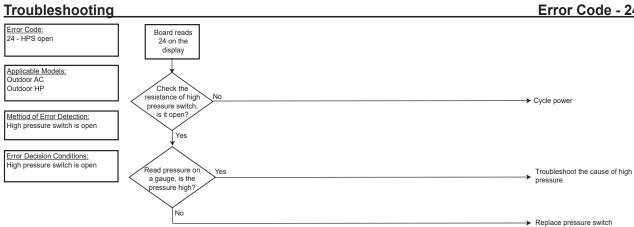

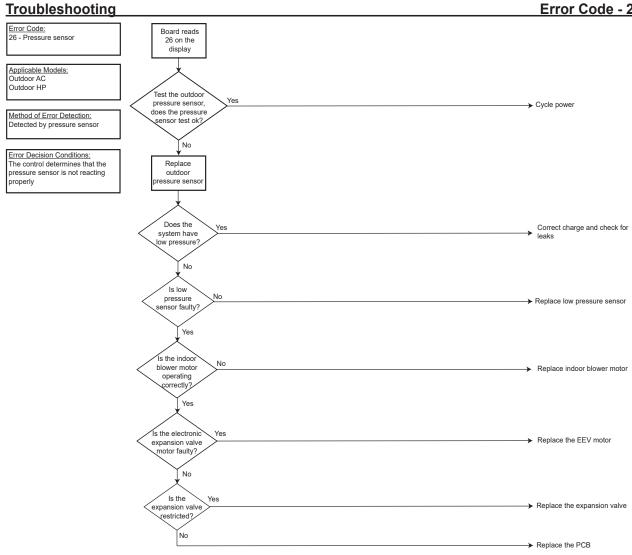

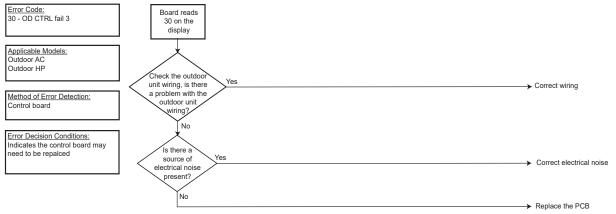

#### Error Code 23, 25, 27, 28, 29

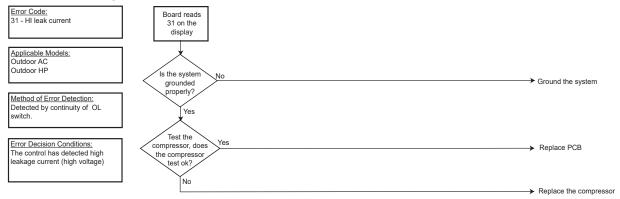

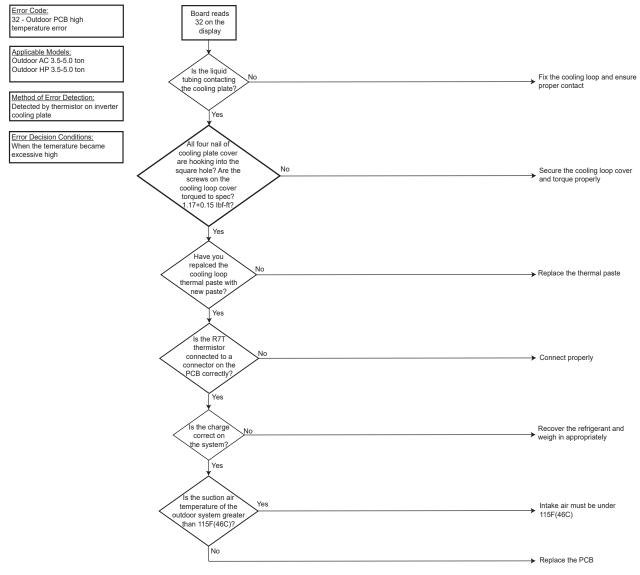

# Board reads 32 - Outdoor PCB high temperature error Applicable Models: Outdoor AC 1.5-3.0 ton Outdoor HP 1.5-30. ton Method of Error Detection: Detected by thermistor on inverter

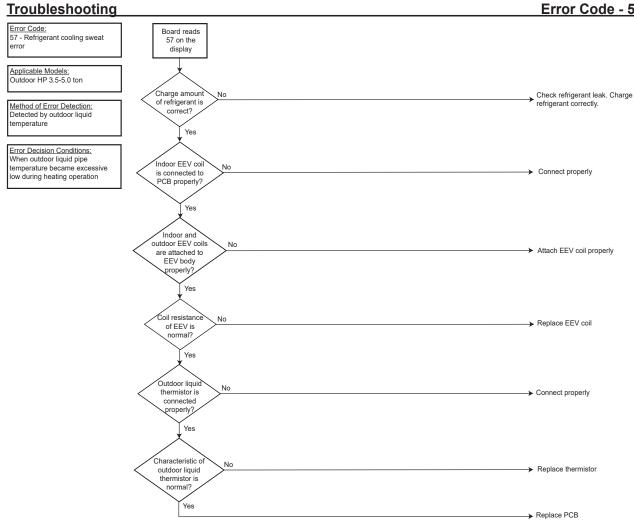

Error Decision Conditions: When the temerature became excessive high

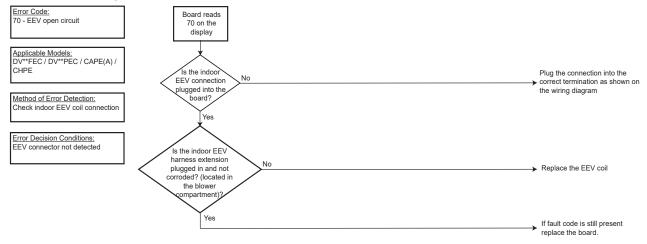

#### → Open stop valves Yes Remove any obstructions around the outdoor coil or discharge grill No Is the error still present? → Keep running Yes is there a short on the control circuit? Is the suction air temperature → Resolve the short. Intake air must be under 115F (46C) Yes of the outdoor unit higher than 115F (46C)? No Cycle power to the equipment. Is the error still Yes ➤ Replace the PCB present? No → Keep running

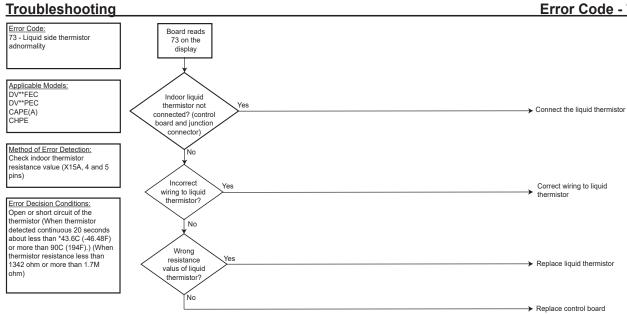

### Error Code - 32 with cooling loop

\*Revision level that may or may not be designated.

NOTE: Airflow selection should meet the minimum requirements as mentioned in the air handler Installation instructions.

For heater kit installation, it is important to set the capacity of the electric heater at Set-up menu on the thermostat and DIP switch on indoor unit control board. For more information, please see indoor unit I/O manual.
